

EXAMPLE 5

RANGE

A large bakery regularly orders cartons of Maine blueberries. The average weight of the cartons is supposed to be 22 ounces. Random samples of cartons from two suppliers were weighed. The weights in ounces of the cartons were

Supplier I:	17	22	22	22	27
Supplier II:	17	19	20	27	27

- (a) Compute the range of carton weights from each supplier.

$$\text{Range} = \text{Largest value} - \text{Smallest value}$$

$$\text{Supplier I range} = 27 - 17 = 10 \text{ ounces}$$

$$\text{Supplier II range} = 27 - 17 = 10 \text{ ounces}$$

- (b) Compute the mean weight of cartons from each supplier. In both cases the mean is 22 ounces.

- (c) Look at the two samples again. The samples have the same range and mean. How do they differ? The bakery uses one carton of blueberries in each blueberry muffin recipe. It is important that the cartons be of consistent weight so that the muffins turn out right.

Supplier I provides more cartons that have weights closer to the mean. Or, put another way, the weights of cartons from Supplier I are more clustered around the mean. The bakery might find Supplier I more satisfactory.

Variance
Standard deviation

As we see in Example 5, although the range tells the difference between the largest and smallest values in a distribution, it does not tell us how much the other values vary from one another or from the mean.

Variance and Standard Deviation

We need a measure of the distribution or spread of data around an expected value (either \bar{x} or μ). Variance and standard deviation provide such measures. Formulas and rationale for these measures are described in the next Procedure display. Then, Examples and Guided Exercises show how to compute and interpret these measures.

As we will see later, the formulas for variance and standard deviation differ slightly depending on whether we are using a sample or the entire population.

PROCEDURE

HOW TO COMPUTE THE SAMPLE VARIANCE AND SAMPLE STANDARD DEVIATION

Quantity	Description
x	The variable x represents a data value or outcome.
Mean $\bar{x} = \frac{\sum x}{n}$	This is the average of the data values , or what you “expect” to happen the next time you conduct the statistical experiment. Note that n is the sample size.
$x - \bar{x}$	This is the difference between what happened and what you expected to happen. This represents a “deviation” away from what you “expect” and is a measure of risk.
