Proteins & Protein Structure Worksheet

By the end of this packet, you will know the answer to the following questions:

1. What elements are proteins made of?
2. What is the structure of a protein?
3. How are proteins used in the body?

Background Reading:

Overview:

Proteins are a diverse group of macromolecules (see *Figure to the right*). Proteins are composed of one or more amino acids. There are only 20 different amino acids in the human body! Yet, the genomes (DNA code) of most organisms specify the amino acid sequences of thousands or tens of thousands of proteins.

Amino acids can be theoretically linked to form protein molecules in any imaginable size or sequence. For example, in a protein made of 100 amino acids, there are trillions of possible protein sequences. However, only a small fraction is actually produced in all living organisms. An important reason for this is because there is a complex set of structural and functional properties of naturally occurring proteins. This selection has evolved over billions of years in response to natural selection.

Proteins serve as structural materials in all living organisms (ex: actin and myosin in animal muscle cells). Proteins are also involved in diverse functions, such as catalysis (speeding up of chemical reactions), metabolic regulation (communication vs hormones), transport (muscle fibers), and defense (antibodies from white blood cells).

To the right you will find the structures of various amino acids found in the human body. **Note:** All amino acids have the elements CHON in their chemical makeups.

Computational Approaches to Nuclear Receptors Pietro Cozzini,Glen E. Kellogg,2012 Nuclear receptors NR are ligand induced activated transcription factors that are involved in numerous biological processes Since the 1990 s when the first structures were determined by means of X ray diffraction the number of NR structures has increased considerably Moreover several omics projects genomics pharmacogenomics and proteomics have opened up great opportunities for the discovery of new targets the characterization of abnormal protein patterns the selection of tailored drugs and the evaluation of drug efficacy even with a lack of structural data Furthermore structure based drug design computational methods for in silico screening and nanobiotechnology based tools are simplifying this time consuming and money intensive research of lead compounds and possibly new drugs Biological interactions such as those that occur between a protein and ligand are concerted events where flexible molecules interact Thus understanding flexibility of large molecules or biological complexes is of primary importance to help define the right model to approximate the reality for drug discovery virtual screening food safety analysis etc NRs are known as flexible targets with many structural similarities in particular for their Ligand Binding Domain these similarities could be assumed to share behavioural qualities that belong to this class of compounds Thus to supply a possible complete and exhaustive answer to questions about the behaviour of NRs their interactions with new potential drugs endocrine disruptors such as animal and human food toxins food additives or industry residuals it is

mandatory to approach the problem from a different point of view a molecular modelling approach steered synthesis and in vitro and in vivo tests etc The aim of this book is to provide a state of the art review on investigations into Nuclear Receptors
