**Protein Synthesis** Abraham K. Abraham, Thor S. Eikhom, Ian F. Pryme, 2012-12-06 During the past decade we have witnessed several major discoveries in the area of protein synthesis and post translational modification of protein molecules In this volume many of the latest research developments in these fields are reported by the distinguished international group of scientists who presented their state of the art results at the 13th Linderström Lang Conference held at Gøteborg Norway June 14-18 1983 We feel that the presentation here of so wide a variety of articles on both the molecular and the cellular aspects of protein synthesis will be of considerable value to many scientists working in the area who were unable to attend as well as to many who are active in related areas In addition to the research papers the contents of the six scientific sessions held during the conference have been summarized by the respective session chairmen These individual summaries provide insightful syntheses of all the recent progress in each field identify which current problems remain of special interest and suggest what the future may hold in the several areas of protein synthesis research covered Though this volume obviously cannot provide a complete survey of all important ongoing research on the molecular and cellular biology of translational and post translational events we are confident that it will facilitate a much better understanding of many important contemporary problems in research on protein synthesis including cell differentiation translational accuracy protein modification intracellular transport and membrane turnover

*Nucleic Acids and Protein Synthesis in Plants* L. Bogorad,2012-12-06 During the summer of 1974 we discussed the state of molecular biology and biochemical developmental biology in plants on a few occasions in Paris and in Strasbourg The number of laboratories engaged in such research is minute compared with those studying comparable problems in animal and bacterial systems but by then much interesting work had been done and a great momentum was building It seemed to us that the summer of 1976 would be a good time to review these areas of plant biology for students as well as advanced workers We outlined a program for a course to colleagues both in Europe and the United States and asked a few potential lecturers if they would be interested The response was not just positive it was overwhelm ingly enthusiastic Those who had some acquaintance with Alsace and especially with Strasbourg invariably told us that they had two reasons for being

enthusiastic about participating the subject and the proposed site The lectures published here reflect the diversity of current research in plant molecular biology and biochemical developmental biology Each lecture gives us a glimpse of the depth of questions being asked and sometimes answered in segments of this field of investigation This research is directed at fundamental biological problems but answers to these questions will provide knowledge essential for bringing about major changes in the way the world s agricultural enterprise can be improved

*The Rhabdoviruses* Robert R. Wagner,2013-06-29 The viruses of the family Rhabdoviridae have an exceedingly broad host range and are widely distributed throughout the animal and plant kingdoms Animal rhabdoviruses infect and often cause disease in insects fish and mammals including man The prototype rhabdovirus vesicular stomatitis virus VSV has been extensively studied and provides perhaps the best model system for studying negative strand viruses The popularity of VSV as a model system is to a considerable extent due to its relative simplicity and to its rapid growth generally to high titer in many cell types ranging from yeast to human The nucleocapsids of these viruses also carry transcriptional and replicative functions that are expressed in cell free systems The first RNA dependent RNA polymerase was described in VSV and its G protein provided an early model system for studying the synthesis processing and membrane insertion of mammalian glycoproteins VSV is also highly cytopathogenic and has been studied quite extensively for its capacity to kill cells and to shut off cellular macromolecular synthesis Even earlier VSV was discovered to be highly susceptible to the action of interferons and has served ever since as a means for quantitating the activity of interferons To my way of thinking the spark that ignited the explosion of research in this field was struck at the First International Colloquium on Rhabdoviruses attended by 30 or
