Protocols For Micropropagation Of Woody Trees And Fruits:

Protocols for Micropropagation of Woody Trees and Fruits S.Mohan Jain,H. Häggman,2007-09-18

Micropropagation has become a reliable and routine approach for large scale rapid plant multiplication which is based on plant cell tissue and organ culture on well defined tissue culture media under aseptic conditions A lot of research efforts are being made to develop and refine micropropagation methods and culture media for large scale plant multiplication of several number of plant species However many forest and fruit tree species still remain recalcitrant to in vitro culture and require highly specific culture conditions for plant growth and development The recent challenges on plant cell cycle regulation and the presented potential molecular mechanisms of recalcitrance are providing excellent background for understanding on totipotency and what is more development of micropropagation protocols For large scale in vitro plant production the important attributes are the quality cost effectiveness maintenance of genetic fidelity and long term storage The need for appropriate in vitro plant regeneration methods for woody plants including both forest and fruit trees is still overwhelming in order to overcome problems facing micropropagation such as somaclonal variation recalcitrant rooting hyperhydricity polyphenols loss of material during hardening and quality of plant material Moreover micropropagation may be utilized in basic research in production of virus free planting material cryopreservation of endangered and elite woody species applications in tree breeding and reforestation

Micropropagation of Woody Trees and Fruits S.M. Jain,K.

Ishii,2012-12-06 Global warming environmental changes water shortage and sustainable development are the most up to date issues which have challenged mankind Researchers worldwide are engaged in addressing some of these problems including reduction in carbon dioxide accumulation and enrichment of perennial woody species on the terrestrial ecosystem About 12 million hectares of the world s forests disappear every year By 2025 the world population will reach 7 5 billion and the forest area will be reduced to well below 50 % of the current area Reforestation is an important to prevent the loss of forest resources including timber biodiversity and water resources Therefore subsequent volume of reforestation over the deforested land should be followed to safeguard the forests and maintain its size which will require a continuous supply of planting material Similarly fruit trees including tropical and subtropical fruit trees are consumed both as fresh and in the processed form including juices beverages and dried fruits They are an important source of nutrition e g rich in vitamins sugars aromas and flavour compounds and raw material for food processing industries The production cultivation and maintenance of tree species provide highly sustainable production systems that conserve soils microenvironment and biodiversity Fruit trees have longjuvenile periods and large tree size In many fruit trees e g avocado and others controlled crosses are difficult to make due to massive fruit drop

Domestication of Radiata Pine Rowland Burdon, William Libby, Alan Brown, 2017-12-12 In nature radiata pine is very localised and an obscure tree species despite the romantic character of much of its natural habitat That obscure status and the lack of any reputation as a virgin timber slowed its due recognition as a commercial crop Nevertheless it has become a major plantation forest crop internationally It has become the pre eminent commercial forest species in New Zealand Chile and Australia with important plantings in some other countries It consequently features prominently in the international trade in forest products in addition to its importance in domestic markets of grower countries Very fast growth considerable site tolerances ease of raising in nurseries and transplanting and ease of processing and using its wood for a range of products and purposes have made it the utility softwood of choice almost everywhere it can be grown satisfactorily Abundant genetic variation and its amenability to other management inputs created special opportunities for its domestication The story of its domestication forms a classic case history in the development of modern commercial forestry with trailblazing in both genetic improvement and plantation management this inevitably meant a learning process that provided instructive lessons especially for tree breeders dealing with some other species Paradoxically the plantation monocultures have played and can continue to play an important role in protecting natural forests and other forms of biodiversity Given the attractions of growing radiata pine there were inevitably cases of overreach in planting it with lessons to be learnt Economic globalisation has meant globalisation of pests and disease organisms and the scale on which radiata pine is grown has meant it has been the focus of various biotic alarms none of which have proved catastrophic Temptations remain however to pay less than due attention to some aspects of risk management The chapter structure of the book is based on historical periods beginning long before any important human influences and ending with a look into what the future might hold for the species and its role in human and ecological sustainability Almost throughout there has been complex interplay between the technical aspects local social and economic factors various types of institution the enthusiasm and drive of some very influential individuals and tides of economic ideology threads that needed to be woven together to do the story justice
