Levees and the National Flood Insurance Program National Research Council, Division on Earth and Life Studies, Water Science and Technology Board, Committee on Levees and the National Flood Insurance Program: Improving Policies and Practices, 2013-07-18 The Federal Emergency Management Agency's FEMA Federal Insurance and Mitigation Administration FIMA manages the National Flood Insurance Program NFIP which is a cornerstone in the U.S. strategy to assist communities to prepare for, mitigate against, and recover from flood disasters. The NFIP was established by Congress with passage of the National Flood Insurance Act in 1968 to help reduce future flood damages through NFIP community floodplain regulation that would control development in flood hazard areas, provide insurance for a premium to property owners, and reduce federal expenditures for disaster assistance. The flood insurance is available only to owners of insurable property located in communities that participate in the NFIP. Currently, the program has 5,555,915 million policies in 21,881 communities<sup>3</sup> across the United States. The NFIP defines the one percent annual chance flood, 100-year or base flood floodplain as a Special Flood Hazard Area (SFHA). The SFHA is delineated on FEMA's Flood Insurance Rate Maps (FIRM)s using topographic, meteorologic, hydrologic, and hydraulic information. Property owners with a federally backed mortgage within the SFHAs are required to purchase and retain flood insurance called the mandatory flood insurance purchase requirement (MFR). Levees and floodwalls hereafter referred to as levees have been part of flood management in the United States since the late 1700s because they are relatively easy to build and a reasonable infrastructure investment. A levee is a man-made structure usually an earthen embankment designed and constructed in accordance with sound engineering practices to contain, control, or divert the flow of water so as to provide protection from temporary flooding. A levee system is a flood protection system which consists of a levee or levees and associated structures such as closure and drainage devices which are constructed and operated in accordance with sound engineering practices. Recognizing the need for improving the NFIP's treatment of levees, FEMA officials approached the National Research Council's NRC Water Science and Technology Board (WSTB) and requested this study. The NRC responded by forming the ad hoc Committee on Levees and the National Flood Insurance Program: Improving Policies and Practices, charged to examine current FEMA treatment of levees within the NFIP and provide advice on how those levee-related policies and activities could be improved. The study addressed four broad areas: risk analysis, flood insurance, risk reduction, and risk communication regarding how levees are considered in the NFIP. Specific issues within these areas include current risk analysis and mapping procedures, behind accredited and non-accredited levees, flood insurance pricing, and the mandatory flood insurance purchase requirement, mitigation options to reduce risk for communities with levees, flood risk communication efforts, and the concept of shared responsibility. The principal conclusions and recommendations are highlighted in this report. *Design and Construction of Levees*, 2000. The purpose of this manual is to present basic principles used in the design and construction of earth levees. This manual applies to all Corps of

Engineers Divisions and Districts having responsibility for the design and construction of levees This manual is approved for public release distribution is unlimited This manual is intended as a guide for designing and constructing levees and not intended to replace the judgment of the design engineer on a particular project Geotechnical Engineering of Dams, 2nd Edition Robin Fell,Patrick MacGregor,David Stapledon,Graeme Bell,Mark Foster,2014-11-21 Geotechnical Engineering of Dams 2nd edition provides a comprehensive text on the geotechnical and geological aspects of the investigations for and the design and construction of new dams and the review and assessment of existing dams The main emphasis of this work is on embankment dams but much of the text particularly those parts related to geology can be used for concrete gravity and arch dams All phases of investigation design and construction are covered Detailed descriptions are given from the initial site assessment and site investigation program through to the preliminary and detailed design phases and ultimately the construction phase The assessment of existing dams including the analysis of risks posed by those dams is also discussed This wholly revised and significantly expanded 2nd edition includes a lengthy new appendix on the assessment of the likelihood of failure of dams by internal erosion and piping This valuable source on dam engineering incorporates the 200 years of collective experience of the authors in the subject area Design methods are presented in combination with their theoretical basis to enable the reader to develop a proper understanding of the possibilities and limitations of a method For its practical well founded approach this work can serve as a useful guide for professional dam engineers and engineering geologists and as a textbook for university students **Natomas Levee Improvement Program, Phase 3 Landside Improvements Project** ,2009 *Embankments, Dams, and Slopes* ,2007 **Reliability-Based Design in Geotechnical Engineering** Kok-Kwang Phoon,2008-04-25 Reliability based design is the only engineering methodology currently available which can ensure self consistency in both physical and probabilistic terms It is also uniquely compatible with the theoretical basis underlying other disciplines such as structural design It is especially relevant as geotechnical design becomes subject to increasing codification and to code harmonization across national boundaries and material types Already some codes of practice describe the principles and requirements for safety serviceability and durability of structures in reliability terms This book presents practical computational methods in concrete steps that can be followed by practitioners and students It also provides geotechnical examples illustrating reliability analysis and design It aims to encourage geotechnical engineers to apply reliability based design in a realistic context that recognises the complex variabilities in geomaterials and model uncertainties arising from a profession steeped in empiricism By focusing on learning through computations and examples this book serves as a valuable reference for engineers and a resource for students Internal Erosion in Earthdams, Dikes and Levees Stéphane Bonelli,Cristina Jommi,Donatella Sterpi,2018-08-31 This book gathers the peer reviewed contributions presented at the 26th Annual Meeting of the European Working Group on Internal Erosion in Embankment Dams Levees and Dikes and their Foundations EWG IE held in Milano Italy on 10 13 September 2018 The meeting served as a fertile platform

for discussion sharing sound knowledge and introducing novel ideas on issues related to soil internal erosion in water retaining structures The contributions encompass various aspects of laboratory techniques and findings modelling and design criteria as well as prevention measures and field assessment The book is a valuable up to date tool that provides an essential overview of the subject for scientists and practitioners alike and inspires further investigations and research *Flood Handbook* Saeid Eslamian, Faezeh A.
