Code Based Secret Sharing Schemes: Applied Combinatorial Coding Theory

Patrick Sole, Selda Calkavur, Alexis Bonnet, Romar Dela Cruz, 2022-04-11 Secret sharing schemes form one of the most important topic in Cryptography. These protocols are used in many areas: applied mathematics, computer science, electrical engineering. A secret is divided into several pieces called shares. Each share is given to a user of the system. Each user has no information about the secret but the secret can be retrieved by certain authorized coalition of users. This book is devoted to such schemes inspired by Coding Theory. The classical schemes of Shamir, Blakley, Massey are recalled. Survey is made of research in Combinatorial Coding Theory: they triggered mostly self dual codes and minimal codes. Applications to engineering like image processing and key management of MANETs are highlighted.

Dynamic Secrets in Communication Security Sheng Xiao,Weibo Gong,Don Towsley,2013-08-13 Dynamic secrets are constantly generated and updated from messages exchanged between two communication users When dynamic secrets are used as a complement to existing secure communication systems a

stolen key or password can be quickly and automatically reverted to its secret status without disrupting communication. Dynamic Secrets in Communication Security presents unique security properties and application studies for this technology. Password theft and key theft no longer pose serious security threats when parties frequently use dynamic secrets. This book also illustrates that a dynamic secret based security scheme guarantees impersonation attacks are detected even if an adversary steals a user's password or their key is lost. Practitioners and researchers working in network security or wireless communications will find this book a must have reference. Dynamic Secrets in Communication Security is also a valuable secondary text for advanced level students in computer science and electrical engineering.

Digital Asset Management

Unknown Author, 2012-10-12. Content and media asset management systems are core back office applications of the modern day broadcaster, yet there is little information available on the control and management of these systems and how content can be delivered over a variety of different channels: television, iTV, internet, webcasting, mobile phones, and wireless PDAs. This book explains the potential for applying asset management systems to content creation models for distribution over a variety of outlets and the benefits gained from increased efficiency and lowering of costs. Taking an unbiased view and focusing on core principles rather than specific systems, David Austerberry presents the business case for digital asset management systems, demystifies some assumptions regarding the technology, and provides a thorough introduction to the system components required, such as indexing, searching, middleware, database, and rights management, and web portals.
