|----------------------------|---|--|
| State at room temperature: | gases, liquids or low-melting solids | Crystalline solids |
| Polarity: | Low | High |
| Solubility | Few are soluble in water; Many are soluble in organic liquids | Many are water soluble; Not soluble in organic liquids |
| Formation: | A covalent bond is formed between two non-metals that have similar electronegativities. Neither atom is "strong" enough to attract electrons from the other. For stabilization, they share their electrons from outer molecular orbit with others | An ionic bond is formed between a metal and a non-metal. Non-metals(-ve ion) are "stronger" than the metal(+ve ion) and can get electrons very easily from the metal. These two opposite ions attract each other and form the ionic bond. |
| Conductivity: | Do not conduct electricity | Conduct electricity when molten or dissolved in water |
| Melting point: | Low | High |
| What is it?: | Covalent bonding is a form of chemical bonding between two non metallic atoms which is characterized by the sharing of pairs of electrons between atoms and other covalent bonds. | Ionic bond, also known as electrovalent bond, is a type of bond formed from the electrostatic attraction between oppositely charged ions in a chemical compound. These kinds of bonds occur mainly between a metallic and a non metallic atom. |

| Examples: | Methane (CH_4), Hydrochloric acid (HCl) | Sodium chloride (NaCl), Sulfuric Acid (H_2SO_4) |
| Occurs between: | Two non-metals or a non-metal and a metalloid | One metal and one non-metal |

Computational Methods for Reinforced Concrete Structures Ulrich Häußler-Combe,2014-11-24 The book covers the application of numerical methods to reinforced concrete structures To analyze reinforced concrete structures linear elastic theories are inadequate because of cracking bond and the nonlinear and time dependent behavior of both concrete and reinforcement These effects have to be considered for a realistic assessment of the behavior of reinforced concrete structures with respect to ultimate limit states and serviceability limit states The book gives a compact review of finite element and other numerical methods The key to these methods is through a proper description of material behavior Thus the book summarizes the essential material properties of concrete and reinforcement and their interaction through bond These basics are applied to different structural types such as bars beams strut and tie models plates slabs and shells This includes prestressing of structures cracking nonlinear stressstrain relations creeping shrinkage and temperature changes Appropriate methods are developed for each structural type Large displacement and dynamic problems are treated as well as short term quasi static problems and long term transient problems like creep and shrinkage Most problems are illustrated by examples which are solved by the program package ConFem based on the freely available Python programming language The ConFem source code together with the problem data is available under open source rules at concrete fem com The author aims to demonstrate the potential and the limitations of numerical methods for simulation of reinforced concrete structures addressing students teachers researchers and designing and checking engineers **PPI PE Civil Study Guide, 17th**
