Biogeochemical Cycling and Sediment Ecology J. Gray, William Ambrose Jr., Anna Szaniawska, 1999-05-31

Oceanographic discontinuities e g frontal systems upwelling areas ice edges are often areas of enhanced biological productivity Considerable research on the physics and biology of the physical boundaries defining these discontinuities has been accomplished see I D The interface between water and sediment is the largest physical boundary in the ocean but has not received a proportionate degree of attention The purpose of the Nato Advanced Research Workshop ARW was to focus on soft sediment systems by identifying deficiencies in our knowledge of these systems and defining key issues in the management of coastal sedimentary habitats Marine sediments play important roles in the marine ecosystem and the biosphere They provide food and habitat for many marine organisms some of which are commercially important More importantly from a global perspective marine sediments also provide ecosystem goods and services 2J Organic matter from primary production in the water column and contaminants scavenged by particles accumulate in sediments where their fate is determined by sediment processes such as bioturbation and biogeochemical cycling Nutrients are regenerated and contaminants degraded in sediments Under some conditions carbon accumulates in coastal and shelf sediments and may be removed from the carbon cycle for millions of years having a potentially significant impact on global climate change Sediments also protect coasts The economic value of services provided by coastal areas has recently been estimated to be on the order of 12 568 9 10 y 3J far in excess of the global GNP

*Ocean Biogeochemical Dynamics* Jorge L. Sarmiento, 2013-07-17

*Ocean Biogeochemical Dynamics* provides a broad theoretical framework upon which graduate students and upper level undergraduates can formulate an understanding of the processes that control the mean concentration and distribution of biologically utilized elements and compounds in the ocean Though it is written as a textbook it will also be of interest to more advanced scientists as a wide ranging synthesis of our present understanding of ocean biogeochemical processes The first two chapters of the book provide an introductory overview of biogeochemical and physical oceanography The next four chapters concentrate on processes at the air sea interface the production of organic matter in the upper ocean the remineralization of organic matter in the water column and the processing of organic matter in the sediments The focus of these chapters is on analyzing the cycles of organic carbon oxygen and nutrients The next three chapters round out the authors coverage of ocean biogeochemical cycles with discussions of silica dissolved inorganic carbon and alkalinity and  $\text{CaCO}_3$  The final chapter discusses applications of ocean biogeochemistry to our understanding of the role of the ocean carbon cycle in interannual to decadal variability

paleoclimatology and the anthropogenic carbon budget The problem sets included at the end of each chapter encourage students to ask critical questions in this exciting new field While much of the approach is mathematical the math is at a level that should be accessible to students with a year or two of college level mathematics and or physics The Monthly C.T.C.
