Ecology and the Biosphere Sharon L. Hanks, 1996-05-01. Here is a valuable one semester course text for non science majors that delivers. It is concise, focused on material that will enable students to make intelligent choices about the future of the earth, and written in a style that will enable students to make connections to their own lives. Students want to know how science relates to their lives, how the biosphere works, what is wrong with it, and what they can do to make a difference. Now there is a new text that provides the information students need and gives real life examples that make the learning process more interesting and relevant.

THREE MAIN DIVISIONS OF TEXT:

1. What science is and what students need to know about it.
2. The biosphere, how it works, and its current problems.
3. What students can do about the problems.

ABOUT THE AUTHOR: Dr. Sharon LaBonde Hanks teaches biology at William Paterson College in New Jersey. She holds a Ph.D. from Rutgers University. Her 33 years in teaching have concentrated on biology and environmental science, with research focused on ecology, taxonomy, and systematic palynology. She has a special interest in writing about the discipline, assessment, and race/gender issues in science. Hanks is the author of a major text on how to teach biology using the process approach. In addition, she runs workshops and is a consultant, an expert perennial gardener, and a naturalized landscaper and an avid student of Tai Chi. She is most proud of her memberships in the New Jersey Audubon, Weis Ecology Center, Habitat for Humanity, and the Nature Conservancy.

The Second Report on the State of the World's Forest Genetic Resources Food and Agriculture Organization of the United Nations, 2025-03-25. Forests and woodlands provide a huge array of essential benefits for people and the planet, such as hosting biodiversity, supporting livelihoods, protecting soils, regulating water cycles, and mitigating climate change. At the heart of such benefits are forest genetic resources, the heritable materials maintained within and among tree and other woody plant species that are of actual or potential economic, environmental, scientific, or societal value. These genetic resources underpin the resilience, adaptability, and productivity of forests and other tree-based systems, enabling them to withstand environmental stresses and thereby continue providing vital ecosystem services. Drawing on data and information from 77 countries representing more than three quarters of the world's forests, The Second Report on the State of the World's Forest Genetic Resources provides a global assessment of forest genetic resources.

It highlights the crucial role of these resources for sustainable development and examines progress in implementing the Global Plan of Action for the Conservation Sustainable Use and Development of Forest Genetic Resources The report reviews scientific advances and concludes with recommendations for continued action at the national regional and global levels to ensure that forest genetic resources are sustainably managed for the benefit of current and future generations

Introductory Ecology Peter Cotgreave, Irwin Forseth, 2009-04-01 In this age of increasing human domination of the Earth's biological and physical resources a basic understanding of ecology is more important than ever Students need a textbook that introduces them to the basic principles of ecological science one that is relevant to today's world and one that does not overwhelm them with detail and jargon Peter Cotgreave and Irwin Forseth have designed this book to meet the needs of these students by providing a basic synthesis of how individual organisms interact with their physical environment and with each other to generate the complex ecosystems we see around us The unifying theme of the book is biodiversity its patterns causes and the growing worldwide threats to it Basic ecological principles are illustrated using clearly described examples from the current ecological literature This approach makes the book valuable to all students studying ecology Examples have been chosen carefully to represent as wide a range of ecosystems terrestrial and aquatic northern and southern hemisphere and life forms animal plant and microbe as possible Particular attention is paid to consequences of global change on organisms populations ecological communities and ecosystems The end result is a text that presents a readable and persuasive picture of how the Earth's natural systems function and how that functioning may change over the coming century Features include strong coverage of applied and evolutionary ecology applications of ecology to the real world a question orientated approach the only comprehensive treatment of ecology written for the introductory student an emphasis on definitions of key words and phrases an integration of experimental observational and theoretical material examples drawn from all over the world and a wide variety of organisms a logical structure building from the response of individual organisms to physical factors through population growth and population interactions to community structure and ecosystem function suggested further reading lists for each chapter boxes to explain key concepts in more depth dedicated textsite featuring additional information and teaching aids www.blackwellpublishing.com/cotgreave Peter Cotgreave is an animal ecologist who has worked for the University of Oxford and the Zoological Society of London His research interests centre on abundance and rarity within animal communities Irwin Forseth is a plant physiological ecologist who has taught introductory ecology and plant ecology at the University of Maryland since 1982 His research focuses on plant responses to the environment The authors have studied organisms as diverse as green plants insects and mammals in habitats from deserts to tropical rainforests They have worked in ecological research and education in Africa Asia North and South America Europe and the Caribbean

Strahler,2012-01-11 With its unique approach *Visualizing Physical Geography* 2nd Edition captures the reader s attention

and demonstrates why physical geography is relevant to them. It relies heavily on the integration of National Geographic and other visuals with narrative to explore key concepts. New emphasis is placed on environmental issues such as climate change, overpopulation, and deforestation from a geographical perspective. Readers will appreciate this approach because it vividly illustrates the interconnectedness of physical processes that weave together to create our planet's dynamic surface and atmosphere. Principles of Terrestrial Ecosystem Ecology F. Stuart Chapin III, Pamela A. Matson, Harold A.

Mooney, 2006-04-10 Human activities are affecting the global environment in myriad ways with numerous direct and indirect effects on ecosystems. The climate and atmospheric composition of Earth are changing rapidly. Humans have directly modified half of the ice-free terrestrial surface and use 40% of terrestrial production. Our actions are causing the sixth major extinction event in the history of life on Earth and are radically modifying the interactions among forests, fields, streams, and oceans. This book was written to provide a conceptual basis for understanding terrestrial ecosystem processes and their sensitivity to environmental and biotic changes. We believe that an understanding of how ecosystems operate and change must underlie our analysis of both the consequences and the mitigation of human-caused changes. This book is intended to introduce the science of ecosystem ecology to advanced undergraduate students, beginning graduate students, and practicing scientists from a wide array of disciplines. We also provide access to some of the rapidly expanding literature in the many disciplines that contribute to ecosystem understanding. The Economics of Biodiversity Partha Dasgupta, 2024-07-11 Explains the current state of play in relation to biodiversity loss and explores a sustainable path for the future.
