BACKGROUND

The Especially Dangerous Pathogens (EDP) natural and soil foci and the activity of their epizootic manifestations determine the risk level for populations living in unfavorable areas. Sporadic population morbidity in these areas does not allow for accurate forecasting. Epidemiologists in Kazakhstan need a new working tool to aid in making objective EDP epidemic risk forecasts, for taking proper preventive steps.

METHODS

The Consumer Rights Protection Committee in Kazakhstan has developed the Regional Sanitary-Epidemiological Passport (RSEP) that will contain infectious incidence rate dynamics and predictive maps of natural and soil foci for the primary (marker) infections (7 nosologies) , including a forecast for 2-5 years.

Epidemic risk forecasting can be improved with the soil foci data, foci distribution and epizootic activity maps, based on long-term observations of Plague, Anthrax, Tularemia, CCHF, Hemorrhagic fever with renal syndrome (HFRS), Tick-borne encephalitis (TBE) and Brucellosis.

We have developed the EDP forecast methods. In particular, the anthrax risk level is based on the soil foci density (fixed unfavorable localities); risks in the plague, tularemia, CCHF, HFRS, TBE foci are based on the presence and activity of natural vectors, and their viral (bacteria) infection rate; the main indicator for brucellosis is the farm animals' incidence level.

In 2012-13 we tested our approach using the national Electronic Integrated Disease Surveillance System to forecast the disease risk of contracting the CCHF (see figure below). To better support foci data analysis EIDSS was upgraded with a vector surveillance module for monitoring especially dangerous feral herd infection vector types, vector species, collection methods, penside samples and laboratory tests. The forecast proved to be 81.3/88.9% accurate.

Clinical Approach to Sudden Cardiac Death Syndromes Ramon Brugada, 2010-01-18 Clinical cardiologists are encountering an important challenge in the caring of families with inherited cardiac diseases The majority of the inherited cardiac diseases causing sudden death express themselves at variable ages in the form of altered muscle function i e hypertrophic or dilated cardiomyopathy or in the form of arrhythmias i e Brugada syndrome long QT syndrome However it is not uncommon that the first sign of the disease may actually be sudden cardiac death even before the identification of clear clinical abnormalities In this last decade with more than 50 new disease associated genes identified the possibility of genetic

testing has opened a new opportunity to disease diagnosis and prevention Clinical and genetic research is continuously on going not only to identify those at risk but to better define their level or risk still with limited success **Research on Brassicaceae Crops Genomics and Breeding, volume II** Xiangshu Dong,Xiaodong Yang ,Yoonkang Hur,2025-08-13 The family Brassicaceae consists of about 350 genera and 3000 species including many economically important edible and industrial oilseed vegetable condiment and fodder crops Many of these such as Chinese cabbage radish cabbage and rapeseed are cultivated worldwide as important crops The family also contains a rich source of agronomic and economic traits in its highly diverse wild germplasms making them ideal as model species for the investigation of elite traits With the progress made in sequencing technologies as well as the development of modern biotechnologies a great many genomes of Brassicaceae crop species have been sequenced and high quality chromosome scale assemblies were obtained which allows functional genomics GWAS and domestication analysis in these important crops These breakthroughs accelerated the investigation into the evolution of different Brassica species the functional revealing of important genes molecular marker assisted breeding and the application of gene editing technology on the germplasm resources of Brassicaceae crops
