Describe how the embryos changed for each of these organisms from their earliest to latest stages.

Describe how the embryos changed for each of these organisms from their earliest to latest stages.

Species	Anatomical Changes From Early to Late Stages
Human	Developed limbs, defined features in face, neck, ears, loss of tail, tiny fingers present
Chicken	Developed beak, tail shorter, wings and legs developed, head quite large
Rabbit	Tail gone, developed limbs, detailed features in ears and mouth
Tortoise	Shell developed, limbs have developed, tail is thinner, large belly, long tail, beak
Salamander	Has gills, tail and large underbelly
Fish	fins developed, gills, tail and scales

1. Look again at the six embryos in their earliest stages. Describe the patterns you see. What physical similarities exist between each of the embryos?

Same basic shape, circular spots (eyes) and underbelly, all have tails, tiny bumps on underside, hole for ear

2. Does this suggest an evolutionary relationship? Explain how these embryos can be used as evidence of a common ancestor between each of these six organisms.

Examination of vertebrate embryos reveals that during corresponding stages of early development, the embryos appear to be very similar. For example, all vertebrate embryos pass through stages in which they have gill pouches. The pouches eventually develop into the gill apparatus in fish; in later-evolving vertebrates that do not have gills, the gill pouches undergo further refinement and develop into structures associated with the head and neck. Similarly, all early vertebrate embryos have tails, which persist in some animals but regress during the later stages of development of humans. Thus, the individual development of an animal occurs through a series of stages that paint a broad picture of the evolutionary stages (phylogeny) of the species to which it belongs. Brush,Ariel Segal,2015 Historically the scientific method has been said to require proposing a theory making a prediction of something not already known testing the prediction and giving up the theory or substantially changing it if it fails the test A theory that leads to several successful predictions is more likely to be accepted than one that only explains what is already known but not understood This process is widely treated as the conventional method of achieving scientific progress and was used throughout the twentieth century as the standard route to discovery and experimentation But does science really work this way In Making 20th Century Science Stephen G Brush discusses this question as it relates to the development of science throughout the last century Answering this question requires both a philosophically and historically scientific approach and Brush blends the two in order to take a close look at how scientific methodology has developed Several cases from the history of modern physical and biological science are examined including Mendeleev s Periodic Law Kekule s structure for benzene the light quantum hypothesis quantum mechanics chromosome theory and natural selection In general it is found that theories are accepted for a combination of successful predictions and better explanations of old facts Making 20th Century Science is a large scale historical look at the implementation of the scientific method and how scientific theories come to be accepted Handbook of Biology Part III Chandan Sengupta, This handbook and Practice Workbook deal with three different chapters of Biology Worksheets and Practice Papers duly incorporated in this handbook are from the content areas of the living world and their classifications Content Areas 1 Advantages of Classification 2 Taxonomy and Systematics 3 Classification of Animal and PPlant Kingdom 4 Comparative study of different groupps of living organisms *Principles of Genetics* D.
