The key to these methods is through a proper description of material behavior Thus the book summarizes the essential material properties of concrete and reinforcement and their interaction through bond These basics are applied to different structural types such as bars beams strut and tie models plates slabs and shells This includes prestressing of structures cracking nonlinear stressstrain relations creeping shrinkage and temperature changes Appropriate methods are developed for each structural type Large displacement and dynamic problems are treated as well as short term quasi static problems and long term transient problems like creep and shrinkage Most problems are illustrated by examples which are solved by the program package ConFem based on the freely available Python programming language The ConFem source code together with the problem data is available under open source rules at concrete fem com The author aims to demonstrate the potential and the limitations of numerical methods for simulation of reinforced concrete structures addressing students teachers researchers and designing and checking engineers
