Cognitive Aspects of Stimulus Control W. K. Honig,J. Gregor Fetterman,Werner K. Honig,2018-10-24 The study of discrimination and generalization in animals traditionally involves stimuli that are simple uniform and restricted in time or space In recent years the area of stimulus control has been expanded with the use of stimuli that are complex extended in time or space and incorporate or represent natural objects events or locations The contributors to this unique volume have emphasized controlling functions of complex stimulus events such as location or duration and their relation to cognitive processes in animals The chapters cover a wide array of topics including spatial cognition categorization pattern perception numerosity discriminations imagery and spatial tracking thereby addressing the question of how complex events are perceived processed and organized This volume goes beyond other recent books on animal cognition in that it specifically places some well known phenomena within the context of stimulus control

Continuous Models for Cameras and Inertial Sensors Hannes Ovrén,2018-07-25 Using images to reconstruct the world in three dimensions is a classical computer vision task Some examples of applications where

this is useful are autonomous mapping and navigation urban planning and special effects in movies One common approach to 3D reconstruction is structure from motion where a scene is imaged multiple times from different positions e g by moving the camera However in a twist of irony many structure from motion methods work best when the camera is stationary while the image is captured This is because the motion of the camera can cause distortions in the image that lead to worse image measurements and thus a worse reconstruction One such distortion common to all cameras is motion blur while another is connected to the use of an electronic rolling shutter Instead of capturing all pixels of the image at once a camera with a rolling shutter captures the image row by row If the camera is moving while the image is captured the rolling shutter causes non rigid distortions in the image that unless handled can severely impact the reconstruction quality This thesis studies methods to robustly perform 3D reconstruction in the case of a moving camera To do so the proposed methods make use of an inertial measurement unit IMU The IMU measures the angular velocities and linear accelerations of the camera and these can be used to estimate the trajectory of the camera over time Knowledge of the camera motion can then be used to correct for the distortions caused by the rolling shutter Another benefit of an IMU is that it can provide measurements also in situations when a camera can not e g because of excessive motion blur or absence of scene structure To use a camera together with an IMU the camera IMU system must be jointly calibrated The relationship between their respective coordinate frames need to be established and their timings need to be synchronized This thesis shows how to automatically perform this calibration and synchronization without requiring e g calibration objects or special motion patterns In standard structure from motion the camera trajectory is modeled as discrete poses with one pose per image Switching instead to a formulation with a continuous time camera trajectory provides a natural way to handle rolling shutter distortions and also to incorporate inertial measurements To model the continuous time trajectory many authors have used splines The ability for a spline based trajectory to model the real motion depends on the density of its spline knots Choosing a too smooth spline results in approximation errors This thesis proposes a method to estimate the spline approximation error and use it to better balance camera and IMU measurements when used in a sensor fusion framework Also proposed is a way to automatically decide how dense the spline needs to be to achieve a good reconstruction Another approach to reconstruct a 3D scene is to use a camera that directly measures depth Some depth cameras like the well known Microsoft Kinect are susceptible to the same rolling shutter effects as normal cameras This thesis quantifies the effect of the rolling shutter distortion on 3D reconstruction depending on the amount of motion It is also shown that a better 3D model is obtained if the depth images are corrected using inertial measurements

Att anvånda bilder för att skapa vården omkring oss i tre dimensioner är ett klassiskt problem inom datorseende Några exempel på användningsområden är inom navigering och kartering för autonoma system stadsplanering och specialeffekter för film och spel En vanlig metod för 3D rekonstruktion är det som kallas struktur från rörelse Namnet kommer sig av att man avbildar fotograferar en miljö från flera olika platser till exempel genom att flytta kameran Det är därför

got ironiskt att många strukturer för närvarande algoritmer för problem om kameran inte är stilla när bilderna tas exempelvis genom att använda sig av ett stativ Anledningen är att en kamera i närvarande ger upphov till störningar i bilden vilket ger flera bildmätningar och därmed en sämre 3D rekonstruktion Ett välkänt exempel är närvarande skräp medan ett annat är kopplat till användandet av en elektronisk rullande slutare I en kamera med rullande slutare avbildas inte alla pixlar i bilden samtidigt utan istället rad för rad Om kameran rör sig medan bilden tas uppstår därför störningar i bilden som måste tas om hand om för att få en bra rekonstruktion Den här avhandlingen berör robusta metoder för 3D rekonstruktion med flera kameror En fördel är inom arbetet användandet av en trikhsensor IMU En IMU mäter vinkelhastigheter och accelerationer och dessa mätningar kan användas för att bestämma hur kameran har rört sig över tid Kunskap om kamerans närvarande ger möjlighet att korrigera för störningar på grund av den rullande slutaren Ytterligare en fördel med en IMU är att den ger mätningar även i de fall där en kamera inte kan göra det Exempel på sådana fall är vid extrem närvarande skräp starkt motljus eller om det saknas struktur i bilden Om man vill använda en kamera tillsammans med en IMU så måste dessa kalibreras och synkroniseras relationen mellan deras respektive koordinatsystem måste bestämmas och de måste vara verens om vad klockan är I den här avhandlingen presenteras en metod för att automatiskt kalibrera och synkronisera ett kamera IMU system utan krav på exempelvis kalibreringsobjekt eller speciella närvarande nster I klassisk struktur för närvarande representeras kamerans närvarande av att varje bild beskrivs med en kamera pose Om man istället representerar kamerarörelsen som en tidskontinuerlig trajektoria kan man på ett naturligt sätt hantera problematiken kring rullande slutare Det går det också enkelt att införa trikhs mätningar från en IMU En tidskontinuerlig kameratrajektoria kan skapas på flera sätt men en vanlig metod är att använda sig av så kallade splines Formgen hos en spline att representera den faktiska kamerarörelsen beror på hur många knutar placeras Den här avhandlingen presenterar en metod för att uppskatta det approximationsfel som uppkommer vid valet av en förgles spline Det uppskattade approximationsfelet kan sedan användas för att balansera mätningar från kameran och IMU när dessa används för sensorfusion Avhandlingen innehåller också en metod för att bestämma hur många splines behövs för att ge ett gott resultat En annan metod för 3D rekonstruktion är att använda en kamera som också mäter djup eller avstånd Vissa djupkameror till exempel Microsoft Kinect har samma problematik med rullande slutare som vanliga kameror I den här avhandlingen visas hur den rullande slutaren i kombination med olika typer och storlekar av rörelser påverkar den skapade 3D modellen Genom att använda trikhs mätningar från en IMU kan djupbilderna korrigeras vilket visar sig ge en bättre 3D modell

Neural Circuit Development and Function in the Healthy and

Diseased Brain ,2013-05-06 The genetic molecular and cellular mechanisms of neural development are essential for understanding evolution and disorders of neural systems Recent advances in genetic molecular and cell biological methods have generated a massive increase in new information but there is a paucity of comprehensive and up to date syntheses references and historical perspectives on this important subject The Comprehensive Developmental Neuroscience series is designed to fill this gap offering the most thorough coverage of this field on the market today and addressing all aspects of how the nervous system and its components develop Particular attention is paid to the effects of abnormal development and on new psychiatric neurological treatments being developed based on our increased understanding of developmental mechanisms Each volume in the series consists of review style articles that average 15 20pp and feature numerous illustrations and full references Volume 3 offers 40 high level articles devoted mainly to anatomical and functional development of neural circuits and neural systems as well as those that address neurodevelopmental disorders in humans and experimental organisms Series offers 144 articles for 2904 full color pages addressing ways in which the nervous system and its components develop Features leading experts in various subfields as Section Editors and article Authors All articles peer reviewed by Section Editors to ensure accuracy thoroughness and scholarship Volume 3 sections include coverage of mechanisms that control the assembly of neural circuits in specific regions of the nervous system multiple aspects of cognitive development and disorders of the nervous system arising through defects in neural development Handbook of Learning and Cognitive Processes (Volume 3) William K. Estes,2014-06-20 Originally published in 1976 Volume 3 of this Handbook deals primarily with conditions of acquisition retention and forgetting and the manner in which acquired information and motivation combine to determine performance The organization of this volume can be understood in terms of four principal categories The first category deals with general problems of methodology the second and third with basic concepts arising from research on human learning and performance and the fourth with applications Volume 1 presented an overview of the field and introduced principal theoretical and methodological issues that persistently recurred in the expanded treatment of specific research areas which comprise the later volumes The areas traditionally associated with conditioning learning theory and the basic psychology of human learning are treated in Volumes 2 and 3 The last three volumes will range over active lines of research having to do with human cognitive processes at the time Volume 4 attention memory storage and retrieval Volumes 5 and 6 information processing reading semantic memory and problem solving Industries ,1889 *New Sat Rea* Mel Friedman,Lina Miceli,Robert Bell,Michael Lee,Sally Wood,Adel Arshaghi,Suzanne Coffield,Michael McIrvin,Anita Price Davis,Research & Education Association,George DeLuca,Joseph Fili,Marilyn Gilbert,Bernice E.
