*Theoretical Models in Biology* Glenn W. Rowe,1994 This book surveys theoretical models in three broad areas of biology the origin of life the immune system and memory in the brain introducing mathematical and mainly computational models that have been used to construct simulations Most current books on theoretical biology fall into one of two categories a books that specialize in one area of biology and treat theoretical models in considerable depth and b books that concentrate on purely mathematical models with computers used only to find numerical solutions to differential equations for example Although some mathematical models are considered in this book the main emphasis is on stochastic computer models of biological systems Such techniques have a much greater potential for producing detailed realistic models of individual systems and are likely to be the preferred modelling methods of the future By considering three different areas in biology the book shows how several of these modelling techniques have been successfully applied in diverse areas Put simply this book is important because it shows how the power of modern computers is allowing researchers in theoretical biology to break free of the constraints on modelling that were imposed by the traditional differential equation approach Anyone who is interested in the theoretical models of complicated living systems should have this in his or her library G B Ermentrout Bulletin of Mathematical Biology

and why it does so in the way it does      **The Nature of Statistical Evidence** Bill Thompson, 2007-12-21 Our motivation for writing this book was a dissatisfaction with the many books with titles like Foundations of Statistics. These books provide a needed description of the subject with examples of various statistical methods but they do not satisfy the discerning reader because they do not explain why certain conclusions may be drawn from certain data and they do not discuss how statistics the subject meshes with the scientific process. We naively set out to fill in these gaps but the situation is not so simple. What is desired is a tool, the one true statistics which can be applied to data with certainty to justify conclusions but what is available in fact are various competing theories of statistics. The careful reader may correctly point out the relation of this manuscript to postmodern epistemology, a philosophy which emphasizes that all human knowing in fields as diverse as religion and science is culture dependent and that therefore truth is not absolute. Take for example the truths of Christianity and Islam wars have been fought over their differences. In the field of statistics there are for example Bayesians and sampling theorists. Carson 2003 states: Surely it is better postmodernists tell us to encourage insights that flow from many different perspectives. In statistics postmodernism is manifest at two levels. First the findings of statistical applications are not about the true state of nature but about models of experiments on nature.      Foundation GCSE Mathematics Revision and Practice David Rayner, 2015-03-12 Whatever specification you teach GCSE Mathematics Revision and Practice by David Rayner remains an all round winner.
