Mathematics in the Real World W.D. Wallis, 2013-09-20 Mathematics in the Real World is a self contained accessible introduction to the world of mathematics for non technical majors With a focus on everyday applications and context the topics in this textbook build in difficulty and are presented sequentially starting with a brief review of sets and numbers followed by an introduction to elementary statistics models and graph theory Data and identification numbers are then covered providing the pathway to voting and finance Each subject is covered in a concise and clear fashion through the use of real world applications and the introduction of relevant terminology Many sample problems both writing exercises and multiple choice questions are included to help develop students level of understanding and to offer a variety of options to instructors Covering six major units and outlining a one semester course Mathematics in the Real World is aimed at undergraduate liberal art students fulfilling the mathematics requirement in their degree program This introductory text will be an excellent resource for such courses and will show students where mathematics arises in their everyday lives

Probability Theory and Statistics with Real World Applications Peter Zörnig, 2024-08-19 The idea of the book is to present a text that is useful for both students of quantitative sciences and practitioners who work with univariate or multivariate probabilistic models Since the text should also be suitable for self study excessive formalism is avoided though mathematical rigor is retained A deeper insight into the topics is provided by detailed examples and illustrations The book covers the standard content of a course in probability and statistics However the second edition includes two new chapters about distribution theory and exploratory data analysis The first mentioned chapter certainly goes beyond the standard material It is presented to reflect the growing practical importance of developing new distributions The second new chapter studies intensively one and bidimensional concepts like assymetry kurtosis correlation and determination coefficients In particular examples are intended to enable the reader to take a critical look at the appropriateness of the geometrically motivated concepts
