acceptable temperature is not exceeded after short circuits Since many wires in cars are connected to other wires with splices or may suffer short circuits in their electric loads these short circuits can flow across different wires In modular wiring harnesses each of the wires can have different lengths and different installation ratios their cross section affects the cost of the wire harness with different importance as well as the short circuit and the final temperature of the wire The finite volume method is used to simulate the short circuit of series connected wires Finally non linear optimization is used to find the minimum cross sections of wires respecting the constraints of maximum temperature and minimum short circuit current Finally these two different criteria for optima wire dimensioning are combined in the analysis of the on board network of the vehicle in order to make a complete weight and cost minimization of the cable harnesses in a particular vehicle considering also its modularity of loads *Automotive wiring harness assembly* , Suzuki Swift Suzuki Motor Corp,1988 **Mitchell**
