undamaged sample by virtually slicing the reconstructed 3D sample volume In this work the holotomography setup of the synchrotron endstation GINIX The G ttingen Instrument for Nanoscale Imaging with X Rays was extended to a multi scale X ray phase contrast tomography setup suitable for 3D virtual histology by adding two acquisition schemes Compared to the existing setup the first additional scheme is a propagation based microtomography setup which enlarges the reconstructed 3D volumes by a factor of approx 64 at a fraction of the acquisition time ca 2 min The second additional scheme aims for higher resolutions To this end the X ray waveguide illumination was combined with photon counting detector with a large field of view and a novel phase reconstruction scheme which is based on iterative farfield phase retrieval without an empty beam correction in the detector plane *Piping Engineering Leadership for Process Plant Projects* James
