

- 3 a) If a ball of soil is not left around the roots (e.g. if they are pulled out roughly), it will damage the root hair cells on the roots. This will mean the plant will not be able to absorb water so easily, causing it to wilt.
- b) If a cutting has too many leaves, it will lose too much water through transpiration and may wilt or die before it can establish new root growth.
- c) When stomata are in sunken pits in the leaf, a region of humid air is trapped in the pit. This reduces evaporation through the stomata, conserving water in the plant.
- d) Phloem contains products of photosynthesis, such as sugars, which provide food for the greenflies.

4 a) A = epidermis, B = phloem, C = xylem.

b) C. Xylem carries water up the stem. The dye is likely to be carried in this water.

5 a)

Condition	Curve
1	(B)
2	A
3	D
4	C

b) Humid air around the leaf reduces the diffusion gradient between the air spaces in the leaf and the atmosphere around the leaf. Moving air removes the water vapour that might remain near the stomata and slow down diffusion.

6 a) Water forms a thin layer around the cells of the spongy mesophyll of the leaf, then evaporates from this layer and exits through the stomata. The water potential of the mesophyll cells falls, so more water passes from the xylem to the cells by osmosis. A gradient of water potential is set up, from the xylem to the cells.

b) It would increase. A higher temperature would increase the rate of evaporation of water from the mesophyll.

c) Many examples possible, for example:

- cacti have leaves reduced to spines
- leaves rolled into a tube with most stomata facing the inside of the tube
- sunken stomata in pits
- hairy leaves to trap layer of moist air around stomata
