

Tips and Tricks for the Ideal Rotax 912 Installation

Part 4

This article is a continuation of our Rotax 912 installation series. In the first article (August 2005), we discussed the primary differences between the Rotax 912UL, 912ULS, and 914UL engines and how to determine which is best for your application. We also discussed various operating parameters and limitations as well as the ideal markings for the various engine instruments.

In the second article (September 2005), we discussed exhaust system basics including EGT limits and the importance of propeller balancing. We also covered some of the do's and don'ts of the oil lubrication system and Rotax Service Instruction SI-04-1997 R3, which explains how to purge the oil lubrication system of air.

In the third article (November 2005), we discussed the carburetor and fuel system and starters and batteries. This month we'll conclude our series by investigating the 9-series engines' electrical systems and liquid-cooling systems, and by offering some tips on how to install the Rotax ring mount.

The 912 Electrical System: Course 101

The 9-series Rotax aircraft engines have a self-sustaining dual-electronic ignition system that does not require power from the battery to run. Each of the two ignition systems is powered by independent, stationary generating coils located on the ignition housing behind the flywheel. The coils are excited by magnets permanently mounted in the flywheel. Aside from the flywheel, which is mounted directly to the crankshaft, there are no moving parts to wear out in this ignition system: no gears, belts, seals, or bearings. A third set of independent coils provide alternating current (AC) to an external rectifier-regulator that converts it to 14-volt direct current (DC) and regulates the amperage delivered to the battery, based on demand. Expect a maximum output of approximately 18 amps and limit your total electrical load, with all accessories, to less than 80 percent of that, or 14 amps.

Need more power? No problem. You can add an optional external 40-amp alternator (see no. 9 on illustration 1b) and

This Ducati rectifier-regulator is used to convert alternating current (AC) from the 912's internal generator to 12-volt direct current (DC) to power electronic accessories and charge the aircraft battery.

feel free to spend a fortune at your local avionics shop. But, do not run the two charging systems together. You can use the internal, 18-amp system as a backup charging system by controlling both with a three-position, panel-mounted switch. Label the switch alternators as follows:

- Up position: Main 40-amp alternator on.
- Center position: Charging system off.
- Bottom position: Emergency 18-amp alternator on.

You will need to use the remote electric solenoid that comes with the external alternator kit. Do not attempt to run the 40 amps from the external alternator through the panel-mounted switch. **1b**
