INTRODUCTION AND SUMMARY

1. In discussions on proposals for a general medical service for the nation the major details, and suggestions as to how they should be carried out, are of the first importance. Many such details and suggestions are included in subsequent sections of this report. It is necessary, however, to clarify them by a more general and succinct survey in order that each may fall into its proper place.

2. The field is not clear, to start with. If it were it might not be very difficult to construct, at any rate on paper, a health scheme which would be symmetrical, logical, complete, and effective both clinically and administratively. We find, however, the ground occupied—but by no means covered—with a number, even a plethora, of health services better, on the whole, than those existing in any other country. Nevertheless these services, each good in itself, have grown up or been established in a piecemeal, independent, more or less haphazard fashion, and in consequence there is much overlapping and unnecessary complication and confusion, while there are yet large gaps in the provision needed in a reasonably complete service. Moreover, existing areas of health administration are often unsuitable, but any proposals for reform must take into consideration the historical and practical circumstances which have brought them into being.

3. In formulating, then, a scheme for a general medical and health service for the nation it is not attempted to set out one which is ideal in the abstract or even perfectly logical, either in its administrative or in its clinical aspect. We seek, rather, while recognizing existing conditions and circumstances, so to adjust, modify, and extend present services and administrative arrangements as to produce a co-ordinated and, as far as possible, unified system, effective and reasonably complete.

4. In England and Wales the only existing agency which can act as a unifying force is the Ministry of Health.* As such a force, however, it is both ineffective and incomplete. Its several departments appear to function to a great extent independently of one another. It has farmed out the control of the school medical service to the Board of Education in spite of the intentions of Parliament. The control of other important health services remains with the Home Office. It would be an advantage if, for the purposes of central administration and supervision, these divisions and imperfections could be abolished.

5. Locally there are now two systems of medical provision, one under the auspices of the Insurance Committees of counties and county boroughs, another under the auspices of local authorities, either counties or county boroughs or smaller (but often very populous) county districts. These systems are independent of one another,

* In Scotland the appropriate agency is the Department of Health.

Lorene M. Nelson, 2004 This fine text provides a comprehensive overview of methods for epidemiologic and clinical research on neurological disorders The book focuses on classic principles of study design in epidemiologic research strategies for avoiding study biases methods for conducting clinical trials and prognostic studies and principles of evidence based medicine in neurology The text gives neurologists epidemiologists and their students the foundation for conducting rigorous

epidemiologic and clinical research on neurologic disorders **The Neurology of the Elderly** Richard Godwin-Austen, John Bendall, 2012-12-06 Traditional methods in the clinical practice of neurology have dominated clinical teaching in this specialty for about 100 years Essentially these methods involve meticulous attention to detail and the recording of clinical facts Thus the clinical history must be recorded chronologically preferably in the patient's own words and of the nervous system followed by a carefully structured examination tem set out in such a way as to allow the precise localisation of the lesion or system involved Clinical neurology taught and practised in this way has bred generations of neurologists throughout the world and raised the standards in the specialty to a level where clinical skills are probably unexcelled in any other specialty With increasing availability and reliance upon non invasive imaging techniques the need for these skills in large areas of neurological practice has diminished But perhaps more importantly the classical clinical methods in neurology were developed when the elderly population was much smaller and when the specialty of geriatrics did not exist As a result much of the methodology is irrelevant or unreliable in of geriatrics will frequently the elderly population and the student find himself searching in vain in the textbooks of neurology for help in assessing an elderly patient with an atypical presentation for example disturbance of balance or recurrent confusional episodes of some common neurological disorder **Focus on**
