The reduction timing solenoid valve, low clutch timing solenoid valve and 2-4 timing solenoid valve are utilized by the EAT ECU to control the timing of the gear shift changes. These solenoid valves carry out four main functions:

- Shift timing control: For some shifts three solenoid valves are used to assist line pressure control or 2-4 brake pressure control.
- Line pressure cut back: When the gearbox takes up the drive, there should be a high line pressure present. The EAT ECU controls the low clutch timing solenoid valve which is related to the vehicle speed in order to reduce the fluid circuit of the line pressure to on or off therefore controlling cut back.
- Reverse inhibition: If the vehicle exceeds 4 mph (20 km/h) and Reverse (R) is selected, the EAT ECU switches the low clutch timing solenoid valve on. This drains the gearbox fluid from the reverse clutch, therefore the clutch will be unable to engage.
- Idle neutral: The EAT ECU uses the low clutch timing and reduction timing solenoid valves to engage idle neutral.
