*This section describes Mendel's principle of independent assortment. It also tells about traits that are controlled by multiple alleles or multiple genes.*

### Independent Assortment (pages 270-271)

1. In a two-factor cross, Mendel followed \_\_\_\_\_ different genes as they passed from one generation to the next.
2. Write the genotypes of the true-breeding plants that Mendel used in his two-factor cross.

**Phenotype**

**implications** Mauricio César De Marzi, Marisa Mariel Fernandez, Ruben Dario Motrich, Matias Ostrowski, 2024-10-17 In recent years the increase in knowledge about the functioning of the immune system has revealed not only its importance in the defense against external agents such as pathogens or toxins but also in the control of tumor cells and the importance of the processes of inflammation or immunological tolerance. On the one hand, all this knowledge has allowed a better understanding of the putative pathogenic consequences of immune system dysfunction which includes inflammatory autoimmune and immunosuppressive diseases among others. On the other hand, current knowledge about immunoregulation has paved the way to better prevent or control transplantation rejection. However, such mechanisms underlying immune dysregulation are highly variable depending on the type of pathology, systemic chronic inflammatory diseases, autoinflammatory diseases, autoimmune disorders, immunosuppression, and on characteristics of the host such as sex, genetics, nutritional status, etc. Given the wide variety of pathologies that are a consequence of excessive, inefficient or inadequate induction of immune responses, the study of factors involved in the dysregulation of the immune system has gained great attention during the last decades.
