## BACKGROUND

The Especially Dangerous Pathogens (EDP) natural and soil foci and the activity of their epizootic manifestations determine the risk level for populations living in unfavorable areas. Sporadic population morbidity in these areas does not allow for accurate forecasting. Epidemiologists in Kazakhstan need a new working tool to aid in making objective EDP epidemic risk forecasts, for taking proper preventive steps.

## METHODS

The Consumer Rights Protection Committee in Kazakhstan has developed the Regional Sanitary-Epidemiological Passport (RSEP) that will contain infectious incidence rate dynamics and predictive maps of natural and soil foci for the primary (marker) infections (7 nosologies) , including a forecast for 2-5 years.

Epidemic risk forecasting can be improved with the soil foci data, foci distribution and epizootic activity maps, based on long-term observations of Plague, Anthrax, Tularemia, CCHF, Hemorrhagic fever with renal syndrome (HFRS), Tick-borne encephalitis (TBE) and Brucellosis.

We have developed the EDP forecast methods. In particular, the anthrax risk level is based on the soil foci density (fixed unfavorable localities); risks in the plague, tularemia, CCHF, HFRS, TBE foci are based on the presence and activity of natural vectors, and their viral (bacteria) infection rate; the main indicator for brucellosis is the farm animals' incidence level.

In 2012-13 we tested our approach using the national Electronic Integrated Disease Surveillance System to forecast the disease risk of contracting the CCHF (see figure below). To better support foci data analysis EIDSS was upgraded with a vector surveillance module for monitoring especially dangerous feral herd infection vector types, vector species, collection methods, penside samples and laboratory tests. The forecast proved to be 81.3/88.9% accurate.
