interest of the sponsors of the other popular averages, it has not received the widespread recognition that it justly deserves.

The Wilshire 5000 is compared to the DJIA in Chart 18-3. The relationship, just like that between the DJIA and the S&P Composite, is in gear for the vast majority of the time. It is when they disagree that a warning of a potential reversal in trend is given. We saw one develop in 1997. However, this was not followed by a trend change. In such situations it is often best to wait some kind of trend-reversal signal to act as confirmation. In this instance neither series violated its 40-week MA, although the DJIA came pretty close. Later we saw a positive divergence at the 1998 bottom. Both series subsequently confirmed by crossing above their respective average. Finally, the 2000 top experienced a divergence as the DJIA topped out in January and the Wilshire in March. The MA crossovers were not reliable in this instance, but there was little doubt once the Wilshire had violated its 2-year secondary up trendline. In actual fact this was the neckline of an upward-sloping head-and-shoulders pattern.

### The Market Averages Using MAs

When experimenting with an MA from the point of view of trend determination, it is necessary to first assess the type of cycle to be considered. The

4-year stock market cycle has corresponded to the U.S. business cycle for many decades. Since the stock market is greatly influenced by business cycle developments, this 4-year (or to place it more exactly, 41-month) cycle is of great significance in trend determination. Consequently, the choice of an MA to detect such swings is limited to anything less than the full period, that is, 41 months, since an MA covering this whole time span would smooth out the complete cycle and theoretically become a straight line. In practice, the MA does fluctuate, since the cycle is rarely limited exactly to its average 41 months and varies in magnitude of price change. Through computer research<sup>1</sup> it has been found that a 12-month MA for the S&P Composite was the most reliable between 1910 and the early 1990s. This was not true for every decade but for the period as a whole.

In his book *The Stock Market Indicator*, William Gordon calculated that a 40-week crossover gave 29 buy and sell signals for the DJIA between 1897 and 1967. The average gain for all buy signals (that is, between the buy and sell signals) was 17 percent, and the average change from sell signals was 4 percent. For investors using the buy signals to purchase stocks, nine of the

<sup>1</sup>Robert W. Gallo and Thomas A. Moore, *The Development of Statistical Market Indicators*, Dow Jones-Irwin, 1988, Irwin Press, Piquette, N.J., 1988. The actual rule used for buy signals was as follows: "If the 120-day (40-week) average line crosses up following a previous decline. If it is advancing and the price of the stock possesses that average line on the upside, this constitutes a major buying signal."
