the engine works at full stroke all the time this doesn't matter for the valve can be made to work properly at full stroke regardless of the link radius. If however it is intended to work expansively then difficulties arise at once if the link is of an improper radius for the lead increases or decreases alarmingly with any shift of the link if the rods are straight connected or open as it is called. If the rods are crossed then the lead decreases toward mid gear. It might be supposed that when the rods are of the proper length and the link is of the correct radius then there would be no motion of the valve with the link in mid gear but this is not the case for it will be observed by the diagram that the centres of the eccentric wheels and the centre of the shaft are not coincident so that in a complete revolution there is an eccentricity of
