

Secant and Tangent Relationships

Tangent Theorem: The perpendicular (or segment, or ray) is perpendicular to the radius of the circle at tangency.

This theorem is often used to solve right triangle problems with circles.

Secant Theorem 1: If two secant segments from a point outside the circle intersect the circle, the products of the measures of the segments of the secants are equal.

$$TA \cdot AT = WB \cdot BT$$

$$TA = 12$$

$$WB = 8$$

$$BT = 10$$

$$AT = \underline{\hspace{2cm}}$$

Secant Theorem 2: If two secant segments are drawn to a circle from an external point outside the circle, the product of the measures of one secant segment and its external secant segment is equal to the product of the measures of the other secant segment and its external secant segment.

$$CP \cdot PA = DP \cdot PB$$

$$CP = 12$$

$$DP = 8$$

$$PB = 10$$

$$PA = \underline{\hspace{2cm}}$$

Tangents and Secants of Algebraic Varieties F. L. Zak, 1993 The book is devoted to geometry of algebraic varieties in projective spaces Among the objects considered in some detail are tangent and secant varieties Gauss maps dual varieties hyperplane sections projections and varieties of small codimension Emphasis is made on the study of interplay between irregular behavior of higher secant varieties and irregular tangencies to the original variety Classification of varieties with unusual tangential properties yields interesting examples many of which arise as orbits of representations of algebraic groups
