Introduction to Combinatorics Walter D. Wallis, John C. George, 2016-12-12

What Is Combinatorics Anyway Broadly speaking combinatorics is the branch of mathematics dealing with different ways of selecting objects from a set or arranging objects. It tries to answer two major kinds of questions: namely counting questions (how many ways can a selection or arrangement be chosen with a particular set of properties) and structural questions (does there exist a selection or arrangement of objects with a particular set of properties). The authors have presented a text for students at all levels of preparation. For some this will be the first course where the students see several real proofs. Others will have a good background in linear algebra, will have completed the calculus stream and will have started abstract algebra. The text starts by briefly discussing several examples of typical combinatorial problems to give the reader a better idea of what the subject covers. The next chapters explore enumerative ideas and also probability. It then moves on to enumerative functions and the relations between them and generating functions and recurrences. Important families of functions or numbers and then theorems are presented. Brief introductions to computer algebra and group theory come next. Structures of particular interest in combinatorics: posets, graphs, codes, Latin squares and experimental designs follow. The authors conclude with further discussion of the interaction between linear algebra and combinatorics. Features: Two new chapters on probability and posets. Numerous new illustrations, exercises and problems. More examples on current technology use. A thorough focus on accuracy. Three appendices: sets, induction and proof techniques, vectors and matrices and biographies with historical notes. Flexible use of Maple™ and Mathematica™.

Systems: Approaches, Theories, Applications W.E.

Hartnett, 2012-12-06 For many years I have believed in a particular style of education for myself. The idea is to focus on matters that you want to learn about, find a modest amount of money and then organize a symposium of those matters, inviting knowledgeable individuals to participate and by extension to come and help with my education. The Eighth George Hudson Symposium held at Plattsburgh, New York on April 11-12, 1975, was another attempt on my part to learn something. The ostensible reason for the Symposium was explained in the Announcement of the Symposium as follows: Systems Theory is currently one of the exciting areas of intellectual activity, attracting persons from diverse disciplines. In fact, it has almost become the prototype of interdisciplinary effort. As such, it needs the interchange of ideas, viewpoints and opinions as a necessary condition for growth. This Symposium was convened to bring together a number of persons, some of them experts and some beginners, for two days of concentrated interaction on Systems Theory. The breadth of the interests of the invited speakers can be noted from their home disciplines, but space limitations forestall any attempt to document their actual current interests, which range from brain function to political institutions to technoethics. The speakers were chosen for their expository and interactive ability as well as for their work in Systems Theory, and ample time has been allowed for discussion with them.
