## Layers of the Atmosphere: An Exploration

The Earth's atmosphere is divided into five layers, each with unique characteristics. Understanding these layers is essential for grasping how our planet's environment works.

**Troposphere:** The lowest layer, extending from the surface to about 10-12 km. It's where most weather occurs, and temperature decreases with altitude.

**Stratosphere:** The layer above the troposphere, extending to about 50 km. Temperature increases with altitude due to the ozone layer absorbing UV radiation.

**Mesosphere:** The layer above the stratosphere, extending to about 85 km. Temperature decreases with altitude.

**Thermosphere:** The layer above the mesosphere, extending to about 600 km. Temperature increases with altitude due to the absorption of high-energy solar radiation.

**Exosphere:** The outermost layer, extending from about 600 km to the edge of space. It's composed of thin layers of gas that eventually escape into space.
