Holt, 2012-12-06 This monograph is based on a graduate course Mechanical Engineering 266 which was developed over a number of years at the University of California Berkeley Shorter versions of the course were given at the University of Paris VI in 1969 and at the University of Paris XI in 1972 The course was originally presented as the last of a three quarter sequence on Compressible Flow Theory with emphasis on the treatment of non linear problems by numerical techniques This is reflected in the material of the first half of the book covering several techniques for handling non linear wave interaction and other problems in Gas Dynamics The techniques have their origins in the Method of Characteristics in both two and three dimensions Besides reviewing the method itself the more recent techniques derived from it firstly by Godunov and his group and secondly by Rusanov and his co workers are described Both these approaches are applicable to steady flows calculated as asymptotic states of unsteady flows and treat elliptic problems as limiting forms of unsteady hyperbolic problems They are therefore applicable to low speed as well as to high speed flow problems The second half of the book covers the treatment of a variety of steady flow problems including effects of both viscosity and compressibility by the Method of Integral Relations Telenin's Method and the Method of Lines

Roache, 1995-06-29 One of the first things a student of partial differential equations learns is that it is impossible to solve elliptic equations by spatial marching This new book describes how to do exactly that providing a powerful tool for solving problems in fluid dynamics heat transfer electrostatics and other fields characterized by discretized partial differential equations Elliptic Marching Methods and Domain Decomposition demonstrates how to handle numerical instabilities i.e. limitations on the size of the problem that appear when one tries to solve these discretized equations with marching methods The book also shows how marching methods can be superior to multigrid and pre conditioned conjugate gradient PCG methods particularly when used in the context of multiprocessor parallel computers Techniques for using domain decomposition together with marching methods are detailed clearly illustrating the benefits of these techniques for applications in engineering applied mathematics and the physical sciences
