Interdisciplinary Research in Diabetology Ali Tootee, Bagher Larijani, Ping Wang, 2024-10-04. The prevalence of diabetes has alarmingly increased in both developed and developing countries in recent years. The prevalence of different complications and comorbid conditions associated with diabetes has also rampantly increased, thereby endangering the lives of patients with diabetes. In fact, obesity which is associated with diabetes is currently a major global public health concern. Nevertheless, it can be argued that little progress has been made in the field of the management of diabetes during the past decades and many believe that the discovery of insulin was not followed by further significant advancements in the management of diabetes. Diagnostic and screening approaches to diabetes have considerably evolved in recent decades. Saccharometers are replaced by glucometers and elaborated laboratory techniques. However, there are still limitations to such technologies and they cannot be used on large scales and in pediatric endocrinology they are not well complied with. In fact, it may be argued that the progress we have made in the management of diabetes has mainly focused on the invention of more efficient insulin preparations and improved techniques for its delivery.

The Integration of Clinical Veterinary Anatomy and Diagnostic Imaging Sokol Duro, Tomasz Szara, Ozan Gündemir, 2025-06-02. The study and application of anatomical structures play a crucial role in various procedures such as orthopaedic intervention, nerve blocks, pain

management and diagnostics A comprehensive understanding of these anatomical intricacies is vital for accurate treatment administration and ensuring patient safety Concurrently diagnostic imaging anatomy employing techniques such as radiography ultrasound CT scans and MRI is pivotal in diagnosing and treating a wide range of medical conditions in animals These techniques offer non invasive visualization of internal structures guide treatment decisions and facilitate monitoring of disease progression and treatment efficacy However there is a growing need for better integration of clinical and imaging anatomy to develop tailored treatment plans advance veterinary medicine and innovate diagnostic imaging techniques The primary objective of this Research Topic is to publish original research work reviews case reports or short communications that provide an update on the most recent advances in the integration of clinical veterinary anatomy and diagnostic imaging This integration not only supports research and innovation in veterinary medicine but also contributes to advancements in disease modeling treatment modalities and longitudinal disease monitoring By combining clinical and imaging anatomy veterinarians and scientists can gain a deeper understanding of disease pathophysiology assess treatment efficacy and improve patient outcomes To gather further insights into the integration of clinical veterinary anatomy and diagnostic imaging we welcome articles addressing but not limited to the following themes The role of clinical anatomy in accurate nerve block and effective surgical intervention paths The power of veterinary imaging techniques as essential tools for diagnosing and treating various medical conditions in animals The role of advanced imaging techniques such as CT and MRI in 3D modeling in veterinary medicine The importance of morphometric measurements through imaging techniques in veterinary orthopaedic surgery This Research Topic aims to provide the latest information on these themes and will be of interest to researchers and clinicians working in the area of veterinary clinical practice and veterinary diagnostic imaging

MRI in Veterinary Neurology Adriano Wang-Leandro,2024-11-18 Magnetic resonance imaging is without a doubt a key diagnostic tool in clinical veterinary neurology Its implementation in animals dates to the early 80s as dogs were used as experimental model for brain edema and abscesses however it was not until one decade later that this modality was implemented for clinical purposes in veterinary neurology As the availability of low and high field magnets in veterinary centers increase and technology advances the understanding of central nervous system pathologies in the pre mortem phase including temporal evolvement of disease and monitoring effects of therapeutic approaches to the nervous tissue morphology has been likewise enhanced Moreover MRI findings of multiple diseases affecting the nervous system of animals including epilepsy meningoencephalitis neurodegenerative disorders metabolic encephalopathies spinal cord injury among others mirror their counterpart in human medicine therefore highlighting the pivot role of this modality for translational medicine
