

## Unit 10 – Parametric and Polar Equations - Classwork

Until now, we have been representing graphs by single equations involving variables  $x$  and  $y$ . We will now study problems with which 3 variables are used to represent curves. Consider the path followed by an object that is propelled into the air at an angle of  $45^\circ$ . If the initial velocity of the object is 48 feet per second, the object follows the parabolic path given by

$$y = -\frac{x^2}{72} + x$$

However, although you have the path of the object, you do not know *when* the object is at a given time. In order to do this, we introduce a third variable  $t$ , called a **parameter**. By writing both  $x$  and  $y$  as a function of  $t$ , you obtain the parametric equations:

$$x = 24t\sqrt{2} \quad \text{and} \quad y = -16t^2 + 24t\sqrt{2}$$

From this set of equations, we can determine that at the time  $t = 0$ , the object is at the point  $(0, 0)$ . Similarly at the time  $t = 1$ , the object is at the point  $(24\sqrt{2}, 24\sqrt{2} - 16)$ .

### Definition of a Plane Curve

If  $f$  and  $g$  are continuous functions of  $t$  on an interval  $I$ , then the equations  

$$x = f(t) \quad \text{and} \quad y = g(t)$$

are called **parametric equations** and  $t$  is called the parameter. The set of points  $(x, y)$  obtained as  $t$  varies over the interval  $I$  is called the graph of the parametric equations. Taken together, the parametric equations and the graph are called a plane curve.

When sketching a curve by hand represented by parametric equations, you use increasing values of  $t$ . Thus the curve will be traced out in a specific direction. This is called the **orientation** of the curve. You use arrows to show the orientation.

Example 1) Sketch the curve described by the parametric equations:

$$x = t^2 - 4 \quad \text{and} \quad y = \frac{t}{2} \quad -2 \leq t \leq 3$$
