

Unit 10 – Parametric and Polar Equations - Classwork

Until now, we have been representing graphs by single equations involving variables x and y . We will now study problems with which 3 variables are used to represent curves. Consider the path followed by an object that is propelled into the air at an angle of 45° . If the initial velocity of the object is 48 feet per second, the object follows the parabolic path given by

$$y = -\frac{x^2}{72} + x$$

However, although you have the path of the object, you do not know *when* the object is at a given time. In order to do this, we introduce a third variable t , called a **parameter**. By writing both x and y as a function of t , you obtain the parametric equations:

$$x = 24t\sqrt{2} \quad \text{and} \quad y = -16t^2 + 24t\sqrt{2}$$

From this set of equations, we can determine that at the time $t = 0$, the object is at the point $(0, 0)$. Similarly at the time $t = 1$, the object is at the point $(24\sqrt{2}, 24\sqrt{2} - 16)$.

Definition of a Plane Curve

If f and g are continuous functions of t on an interval I , then the equations

$$x = f(t) \quad \text{and} \quad y = g(t)$$

are called **parametric equations** and t is called the parameter. The set of points (x, y) obtained as t varies over the interval I is called the graph of the parametric equations. Taken together, the parametric equations and the graph are called a plane curve.

When sketching a curve by hand represented by parametric equations, you use increasing values of t . Thus the curve will be traced out in a specific direction. This is called the **orientation** of the curve. You use arrows to show the orientation.

Example 1) Sketch the curve described by the parametric equations:

$$x = t^2 - 4 \quad \text{and} \quad y = \frac{t}{2} \quad -2 \leq t \leq 3$$
