Verification	Validation
1. Verification is a static practice of verifying documents, design, code and program.	1. Validation is a dynamic mechanism of validating and testing the actual product.
2. It does not involve executing the code.	2. It always involves executing the code.
3. It is human based checking of documents and files.	3. It is computer based execution of program.
4. Verification uses methods like inspections, reviews, walkthroughs, and Desk-checking etc.	4. Validation uses methods like black box (functional) testing, gray box testing, and white box (structural) testing etc.
5. **Verification** is to check whether the software conforms to specifications.	5. **Validation** is to check whether software meets the customer expectations and requirements.
6. It can catch errors that validation cannot catch. It is low level exercise.	6. It can catch errors that verification cannot catch. It is High Level Exercise.
7. Target is requirements specification, application and software architecture, high level, complete design, and database design etc.	7. Target is actual product-a unit, a module, a bent of integrated modules, and effective final product.
8. Verification is done by QA team to ensure that the software is as per the specifications in the SRS document.	8. Validation is carried out with the involvement of testing team.
9. It generally comes first-done before validation.	9. It generally follows after **verification**.

Oberkampf,Timothy Guy Trucano,2007 Verification and validation V V are the primary means to assess the accuracy and reliability of computational simulations V V methods and procedures have fundamentally improved the credibility of simulations in several high consequence fields such as nuclear reactor safety underground nuclear waste storage and nuclear weapon safety Although the terminology is not uniform across engineering disciplines code verification deals with assessing the reliability of the software coding and solution verification deals with assessing the numerical accuracy of the solution to a computational model Validation addresses the physics modeling accuracy of a computational simulation by comparing the computational results with experimental data Code verification benchmarks and validation benchmarks have been constructed for a number of years in every field of computational simulation However no comprehensive guidelines have been proposed for the construction and use of V V benchmarks For example the field of nuclear reactor safety has not focused on code verification benchmarks but it has placed great emphasis on developing validation benchmarks Many of these validation benchmarks are closely related to the operations of actual reactors at near safety critical conditions as opposed to being more fundamental physics benchmarks This paper presents recommendations for the effective design and use of code verification benchmarks based on manufactured solutions classical analytical solutions and highly accurate numerical solutions In addition this paper presents recommendations for the design and use of validation benchmarks highlighting the careful design of building block experiments the estimation of experimental measurement uncertainty for both inputs and outputs to the code validation metrics and the role of model calibration in validation It is argued that the understanding of predictive capability of a computational model is built on the level of achievement in V V activities how closely related the V V benchmarks are to the actual application of interest and the quantification of uncertainties related to the application of interest *Knowledge Systems: A Practical Guide to Building Intelligent Applications* Pasquale De Marco,2025-07-16 Journey into the fascinating world of knowledge systems where machines learn from data solve complex problems and make intelligent decisions This comprehensive guide takes you on a deep dive into the principles techniques and applications of knowledge systems empowering you to harness their potential for solving real world challenges Discover the foundations of knowledge representation and acquisition the cornerstone of knowledge systems Explore various methods for representing knowledge from rules and facts to ontologies and semantic networks Learn how to effectively acquire knowledge from diverse sources including human experts historical data and sensor readings Delve into the intricacies of inference and reasoning the heart of knowledge systems Understand the different types of reasoning including forward and backward chaining rule based reasoning and case based reasoning
