Internet Systems 2004: OTM 2004 Workshops R. Meersman, 2004-10-14 This book constitutes the joint refereed proceedings of seven international workshops held as part of OTM 2004 in Agia Napa Cyprus in October 2004 The 73 revised papers presented together with 31 abstracts of posters from the OTM main conferences were carefully reviewed and selected from more than 150 submissions In accordance with the 7 workshops the papers are organized in topical sections on grid computing and its applications to data analysis Java technologies for real time and embedded systems modeling inter organizational systems regulatory ontologies ontologies semantics and e learning PhD symposium and interoperability *On the Move to Meaningful Internet Systems 2004: OTM 2004 Workshops* Zahir Tari, Angelo Corsaro, 2004-10-14 A special mention for 2004 is in order for the new Doctoral Symposium Workshop where three young postdoc researchers organized an original setup and formula to bring PhD students together and allow them to submit their research proposals for selection A limited number of the submissions and their approaches were independently evaluated by a panel of senior experts at the conference and presented by the students in front of a wider audience These students also got free access to all other parts of the OTM program and only paid a heavily discounted fee for the Doctoral Symposium itself In fact their attendance was largely sponsored by the other participants If evaluated as successful it is the intention of the General Chairs to expand this model in future editions of the OTM conferences and so draw in an audience of young researchers to the OnTheMove forum All three main conferences and the associated workshops share the distributed aspects of modern computing systems and the resulting applicati pull created by the Internet and the so called Semantic Web For DOA 2004 the primary emphasis stayed

on the distributed object infrastructure for ODBASE 2004 it was the knowledge bases and methods required for enabling the use of formal semantics and for CoopIS 2004 the main topic was the interaction of such technologies and methods with management issues such as occurs in networked organizations These subject areas naturally overlap and many submissions in fact also treat envisaged mutual impacts among them

Algorithms for Constructing Computably Enumerable Sets Kenneth J. Supowit,2023-05-23 Logicians have developed beautiful algorithmic techniques for the construction of computably enumerable sets This textbook presents these techniques in a unified way that should appeal to computer scientists Specifically the book explains organizes and compares various algorithmic techniques used in computability theory which was formerly called classical recursion theory This area of study has produced some of the most beautiful and subtle algorithms ever developed for any problems These algorithms are little known outside of a niche within the mathematical logic community By presenting them in a style familiar to computer scientists the intent is to greatly broaden their influence and appeal Topics and features All other books in this field focus on the mathematical results rather than on the algorithms There are many exercises here most of which relate to details of the algorithms The proofs involving priority trees are written here in greater detail and with more intuition than can be found

elsewhere in the literature The algorithms are presented in a pseudocode very similar to that used in textbooks such as that by Cormen Leiserson Rivest and Stein on concrete algorithms In addition to their aesthetic value the algorithmic ideas developed for these abstract problems might find applications in more practical areas Graduate students in computer science or in mathematical logic constitute the primary audience Furthermore when the author taught a one semester graduate course based on this material a number of advanced undergraduates majoring in computer science or mathematics or both took the course and flourished in it Kenneth J Supowit is an Associate Professor Emeritus Department of Computer Science Engineering Ohio State University Columbus Ohio US

Dynamic Supply Chain Alignment John Gattorna, 2016-04-29 Just like the world financial system but for different reasons 21st century corporations need a new business model for their enterprise supply chains The old conventions no longer work in this new world of volatile and increasingly unpredictable demand and supply The enterprise needs to become more connected to its own parts as well as its partners up and down the chains it participates in So too we need to embrace new ways of looking at customers to gain deeper more insightful impressions of what they are telling us about the way they want to buy our products and services Finally these signals need converting into corresponding action driven by the people in the business leaders and staff alike who are aligned to their customers wishes This is the world of dynamic supply chain alignment where increasingly supply chains are the business In the follow up to his hugely successful Strategic Supply Chain Alignment John Gattorna's Dynamic Supply Chain Alignment explores how to create and sustain multiple supply chains with a level of flexibility and responsiveness that allow you to respond to opportunities and threats at the same time aligning with your suppliers your partners and your customers When more executives get to this stage of development the profits will flow more readily and sustainability of performance will not be the same issue it is today The way forward is right there in front of us but says John Gattorna we must throw off old ways and embrace the new

Algorithms and Computation Otfried Cheong, Kyung-Yong Chwa, Kunsoo Park, 2010-12-06 Annotation This book constitutes the refereed proceedings of the 21st International Symposium on Algorithms and Computation ISAAC 2010 held in Jeju South Korea in December 2010 The 77 revised full papers presented were carefully reviewed and selected from 182 submissions for inclusion in the book This volume contains topics such as approximation algorithm complexity data structure and algorithm combinatorial optimization graph algorithm computational geometry graph coloring fixed parameter tractability optimization online algorithm and scheduling

Handbook of Computability Theory E.R. Griffor, 1999-10-01 The chapters of this volume all have their own level of presentation The topics have been chosen based on the active research interest associated with them Since the interest in some topics is older than that in others some presentations contain fundamental definitions and basic results while others relate very little of the elementary theory behind them and aim directly toward an exposition of advanced results Presentations of the latter sort are in some cases restricted to a short survey of recent results due to the complexity of the methods and proofs themselves Hence the

variation in level of presentation from chapter to chapter only reflects the conceptual situation itself One example of this is the collective efforts to develop an acceptable theory of computation on the real numbers The last two decades has seen at least two new definitions of effective operations on the real numbers

The Foundational Debate Werner DePauli-Schimanovich, Eckehart Köhler, F. Stadler, 2013-03-14 Constructibility and complexity play central roles in recent research in computer science mathematics and physics For example scientists are investigating the complexity of computer programs constructive proofs in mathematics and the randomness of physical processes But there are different approaches to the explication of these concepts This volume presents important research on the state of this discussion especially as it refers to quantum mechanics This foundational debate in computer science mathematics and physics was already fully developed in 1930 in the Vienna Circle A special section is devoted to its real founder Hans Hahn referring to his contribution to the history and philosophy of science The documentation section presents articles on the early Philipp Frank and on the Vienna Circle in exile Reviews cover important recent literature on logical empiricism and related topics

Boolean Functions and Computation Models Peter Clote, Evangelos Kranakis, 2013-03-09 The foundations of computational complexity theory go back to Alan Turing in the 1930s who was concerned with the existence of automatic procedures deciding the validity of mathematical statements The first example of such a problem was the undecidability of the Halting Problem which is essentially the question of debugging a computer program Will a given program eventually halt Computational complexity today addresses the quantitative aspects of the solutions obtained Is the problem to be solved tractable But how does one measure the intractability of computation Several ideas were proposed A Cobham Cob65 raised the question of what is the right model in order to measure a computation step M Rabin Rab60 proposed the introduction of axioms that a complexity measure should satisfy and C Shannon Sha49 suggested the boolean circuit that computes a boolean function However an important question remains What is the nature of computation In 1957 John von Neumann vN58 wrote in his notes for the Silliman Lectures concerning the nature of computation and the human brain that logics and statistics should be primarily although not exclusively viewed as the basic tools of information theory Also that body of experience which has grown up around the planning evaluating and coding of complicated logical and mathematical automata will be the focus of much of this information theory The most typical but not the only such automata are of course the large electronic computing machines
