**Advances in Information Systems Science** Julius T. Tou, 2012-12-06 Engineering has long been thought of by the public as a profession traditionally categorized into such branches as electrical, mechanical, chemical, industrial, civil, etc. This classification has served its purpose for the past half century, but the last decade has witnessed a tremendous change. A continuous transition from the practical to the theoretical has made technology overlap with science, and the enlargement of scope and broadened diversification have smeared the boundaries between traditional engineering and scientific fields. Engineering is rapidly becoming a diversified multidisciplinary field of scientific endeavor. This has prompted us to regard modern engineering as a science which has as its ingredients materials, energy, and information. In our complex and technologically oriented society, organizations are flooded with an enormous amount of management information. We are now faced with problems concerning the efficient use of communicated knowledge. The steady growth in the magnitude and complexity of information systems necessitates the development of new theories and techniques for solving these information problems. We demand instant access to previously recorded information for decision making, and we require new methods for analysis, recognition, processing, and display. As a consequence, information science has evolved out of necessity. Concerned with the theoretical basis of the organization, control, storage, retrieval, processing, and communication of information, both by natural and artificial systems, information science is multidisciplinary in character. It covers a vast area of subject matter in the physical and biological sciences.
