

Automatic Night Light Control by Using Arduino UNO

Faculty of Electrical and Electronics Engineering, Daffodil International University, Bangladesh

Abstract— Our manuscript aims to develop a system which will lead to energy conservation and by doing so, we would be able to lighten few more homes. A circuit with LDR sensor, Arduino UNO as a main processor, and few of electronic components is designed and implemented to control the electricity based on night. Night light control has been designed and constructed based on LDR sensor as the light range sensing device.

I. INTRODUCTION

This circuit may perform something simple for example in our case switch on AC light ON/OFF and may be extended to controlled a light affected process. The lights are in working functionality over the whole night that consumes a lot of energy and reduces the lifetime of the electrical equipment such as electric bulb etc. In this regard, controlling lighting systems using Light Dependent Resistor (LDR). It is a sensor which is a particular kind of resistor whose resistance decreases when exposed to light. Likewise, it offers high resistance in dark.

This project design to control night light system by using Arduino UNO and LDR. An LDR or light dependent resistor is also known as photo resistor, photocell, photoconductor. It is a one type of resistor whose resistance varies depending on the amount of light falling on its surface. When the light falls on the resistor, then the resistance changes. These resistors have a variety of functions and resistance. For instance, when the LDR is in darkness, then it can be used to turn ON a light or to turn OFF a light when it is in the light.

II. BACKGROUND THEORY

Light Intensity is usually measured to control the switching on and off of the light in the Home Automation system. LDR sensor is the photoresistor that plays a major role in the Light Intensity Measurement circuit.

Devices and circuits are usually designed and simulated on software before building the circuit itself. This ensures circuit safety and makes it easy to build the circuit without worrying about any hazards from the design. Tinkercad is an online simulation software for electronics circuits. Let us explore how to measure Light Intensity using LDR and Arduino

III. HARDWARE REQUIREMENTS

A. Arduino UNO

Fig. Arduino UNO

A board is a microcontroller that is used to accept inputs from sensors connected and provide an output action on the desired device connected to it. The sensor inputs can be from light-detecting sensors, motion sensors (Ultrasonic or IR), temperature sensors, etc. The output from this device can be received through other output devices such as LED, Buzzer, Serial monitor, etc.

B. Resistors

Resistors are passive devices that restrict the flow of current or divide the voltage through the circuit. The input power passes through these resistors and then to the sensors to avoid damage.
