

Projectile Motion Concept

- When an object is projected or thrown into the air it has a certain magnitude and launch angle; these two components combined are called the object's directional vector. This vector is made up of two component vectors; one in the X direction and one in the Y direction. Once the object has left whatever was exerting the force upon it, gravity immediately starts affecting its velocity in the Y direction; accelerating it downward at roughly 9.8 m/s^2 . This force gives the projectile a parabolic motion in the air. The velocity in the X direction however will remain constant throughout its flight (negating air resistance of course!).
