**Intelligent Control Systems** Gábor Szederkényi, R. Lakner, M. Gerzson, 2006-04-18 Intelligent control is a rapidly developing complex and challenging field with great practical importance and potential Because of the rapidly developing and interdisciplinary nature of the subject there are only a few edited volumes consisting of research papers on intelligent control systems but little is known and published about the fundamentals and the general know how in designing implementing and operating intelligent control systems Intelligent control system emerged from artificial intelligence and computer controlled systems as an interdisciplinary field Therefore the book summarizes the fundamentals of knowledge representation reasoning expert systems and real time control systems and then discusses the design implementation verification and operation of real time expert systems using G2 as an example Special tools and techniques applied in intelligent control are also described including qualitative modelling Petri nets and fuzzy controllers The material is

illustrated with simple examples taken from the field of intelligent process control

**Developments in Applied Artificial Intelligence** Tim Hendtlass, Moonis Ali, 2003-08-02 Artificial Intelligence is a field with a long history which is still very much active and developing today

Developments of new and improved techniques together with the ever increasing levels of available computing resources are fueling an increasing spread of AI applications. These applications as well as providing the economic rationale for the research also provide the impetus to further improve the performance of our techniques. This further improvement today is most likely to come from an understanding of the ways our systems work and therefore of their limitations rather than from ideas borrowed from biology. From this understanding comes improvement from improvement comes further application from further application comes the opportunity to further understand the limitations and so the cycle repeats itself indefinitely. In this volume are papers on a wide range of topics some describe applications that are only possible as a result of recent developments others describe new developments only just being moved into practical application. All the papers reflect the way this field continues to drive forward. This conference is the 15th in an unbroken series of annual conferences on Industrial and Engineering Application of Artificial Intelligence and Expert Systems organized under the auspices of the International Society of Applied Intelligence.

**Metalearning** Pavel Brazdil, Christophe Giraud Carrier, Carlos Soares, Ricardo Vilalta, 2008-11-26 Metalearning is the study of principled methods that exploit metaknowledge to obtain efficient models and solutions by adapting machine learning and data mining processes. While the variety of machine learning and data mining techniques now available can in principle provide good model solutions a methodology is still needed to guide the search for the most appropriate model in an efficient way. Metalearning provides one such methodology that allows systems to become more effective through experience. This book discusses several approaches to obtaining knowledge concerning the performance of machine learning and data mining algorithms. It shows how this knowledge can be reused to select combine compose and adapt both algorithms and models to yield faster more effective solutions to data mining problems. It can thus help developers improve their algorithms and also develop learning systems that can improve themselves. The book will be of interest to researchers and graduate students in the areas of machine learning data mining and artificial intelligence.
