Gianluca Tempesti,Andy Tyrrell,Julian F. Miller,2010-08-30 Biology has inspired electronics from the very beginning the

machines that we now call computers are deeply rooted in biological metaphors. Pioneers such as Alan Turing and John von Neumann openly declared their aim of creating artificial machines that could mimic some of the behaviors exhibited by natural organisms. Unfortunately, technology had not progressed enough to allow them to put their ideas into practice. The 1990s saw the introduction of programmable devices, both digital FPGAs and analogue FPAs. These devices, by allowing the functionality and the structure of electronic devices to be easily altered, enabled researchers to endow circuits with some of the same versatility exhibited by biological entities and sparked a renaissance in the field of bio-inspired electronics with the birth of what is generally known as evolvable hardware. Ever since the field has progressed along with technological improvements and has expanded to take into account many different biological processes, from evolution to learning, from development to healing. Of course, the application of these processes to electronic devices is not always straightforward to say the least, but rather than being discouraged, researchers in the community have shown remarkable ingenuity, as demonstrated by the variety of approaches presented at this conference and included in these proceedings.

*Image Analysis and Recognition* Mohamed Kamel, Aurélio Campilho, 2005-10-10. ICIAR 2005, the International Conference on Image Analysis and Recognition, was the second ICIAR conference and was held in Toronto, Canada. ICIAR is organized annually and alternates between Europe and North America. ICIAR 2004 was held in Porto, Portugal. The idea of organizing these conferences came as a result of discussion between researchers in Portugal and Canada to encourage collaboration and exchange, mainly between these two countries but also with the open participation of other countries, addressing recent advances in theory, methodology, and applications.

The response to the call for papers for ICIAR 2005 was encouraging. From 295 full papers submitted, 153 were finally accepted, 80 oral presentations, and 73 posters. The review process was carried out by the Program Committee members and other reviewers, all experts in various image analysis and recognition areas. Each paper was reviewed by at least two reviewers and also checked by the conference co-chairs. The high quality of the papers in these proceedings is attributed first to the authors and second to the quality of the reviews provided by the experts. We would like to thank the authors for responding to our call and we wholeheartedly thank the reviewers for their excellent work and for their timely response. It is this collective effort that resulted in the strong conference program and high quality proceedings in your hands.

**Resting state brain activity: Implications for systems neuroscience** Vinod Menon, Lucina Q. Uddin. Research on resting state brain activity using fMRI offers a novel approach for understanding brain organization at the systems level. Resting state fMRI examines spatial synchronization of intrinsic fluctuations in blood oxygenation level dependent (BOLD) signals arising from neuronal and synaptic activity that is present in the absence of overt cognitive information processing. Since the discovery of coherent spontaneous fluctuations within the somatomotor system (Biswal et al. 1995), a growing number of studies have shown that many of the brain areas engaged during various cognitive tasks also form coherent large-scale brain networks that can be

readily identified using resting state fMRI These studies are beginning to provide new insights into the functional architecture of the human brain This Research Topic will synthesize current knowledge about resting state brain activity and discuss their implications for understanding brain function and dysfunction from a systems neuroscience perspective This topic will also provide perspectives on important conceptual and methodological questions that the field needs to address in the next years In addition to invited reviews and perspectives we solicit research articles on theoretical experimental and clinical questions related to the nature origins and functions of resting state brain activity
