

Identifying Minerals READING WORKSHEET

All rocks are made up of minerals. Rocks have different colors, textures, and shapes. Some rocks or minerals are very hard. Some are soft.

A gemstone is a mineral that is rare and beautiful. Color, luster, radiance, and hardness are properties that make a mineral valuable as a gemstone. Diamonds, rubies, opals, emeralds, and sapphires are all gemstones.

Minerals are identified by their physical properties. A physical property is something you can see, feel, taste, touch, or smell. You can learn to identify many common minerals by paying attention to or testing these properties. The first is **color**. Some minerals are usually one color, but some can be different colors. You cannot identify a mineral by color alone, but it is a useful property to use for identification. The second is **form**. Does it have a crystal shape or grainy fibers?

Luster is the way light is reflected from the mineral. It can be metallic, which is shiny like a metal; or it can be nonmetallic and appear dull, glassy, or pearly.

Streak is another way to identify a mineral. When the mineral is scraped across a porcelain tile, what color does it leave behind? Each mineral makes a streak of a certain color. This color may be different than the color of the mineral itself. For example, the mineral pyrite looks like gold. It is a golden color, but it leaves a greenish-black streak. This is the way to tell if you have found a valuable gold nugget, or just a piece of "fool's gold."

You can also look at the way a mineral breaks. **Cleavage** is breakage along smooth, flat planes. If it fractures, it breaks leaving rough, jagged, or curved lines.

Some minerals have special characteristics by which they can be identified. The way they taste or the way they react with another substance may be a way to identify the mineral. The mineral halite, for example, tastes salty. Calcite will react with a mild acid to produce bubbling.

The final way to identify a mineral is by its **hardness**. The Mohs' Scale of Hardness was developed to help identify common minerals. A German scientist named Friedrich Mohs developed this system for comparing the hardness of a mineral to ten common minerals. Mohs' scale is based on common minerals, not on exact differences in hardness. The difference in hardness between minerals three and four is much less than the difference in hardness between minerals nine and ten. Even though the scale is not exact, it is useful for identifying mineral specimens.

Talc is a mineral that is so soft you can pinch it into powder with your fingers. Diamonds are the hardest minerals found on earth. They can cut glass. A harder mineral can scratch a softer one. Each mineral on the scale can scratch a mineral with a lower number. Your fingernail has a hardness of about 2.5. A fingernail can scratch talc and gypsum, but not calcite.

Mohs' Hardness Scale:

1. Talc softest; can be scratched by a fingernail
2. Gypsum can be scratched by a fingernail but cannot be scratched by talc
3. Calcite can be scratched by a penny
4. Fluorite can be scratched by a steel knife or a nail file
