Gregory, Keke Zhang, 2023-12-11 Dental caries a biofilm mediated multifactorial dynamic disease is identified as

a type of global public health problem Microbes including commensals and opportunistic cariogenic pathogens such as Streptococcus mutants embedded within an extracellular matrix form a highly organized biofilm 3D structure Homeostasis of oral biofilm plays a vital role during caries development according to the ecological plaque hypothesis Under unfavorable conditions such as excessive sugar intake an excess of acid is produced by biofilm which resulted in an acid induced selection promoting the growth of acidogenic and aciduric microbes including opportunistic cariogenic bacteria The transition from eubiosis to imbalance finally promotes tooth hard tissue destruction Thus controlling biofilms is key to controlling caries Though caries has been studied for decades the current situation of this disease is not optimistic From the perspective of biofilm firstly there is a lack of in depth analysis of pathogenic mechanisms Besides mature biofilms are mechanically hard to eliminate and much more resistant to antimicrobial agents than bacterioplankton Moreover materials that filling of decayed teeth are short of antimicrobial activity which contributes to secondary caries

*Crop Improvement in the Era of Next-Generation Sequencing* Manohar Chakrabarti, Umesh K. Reddy ,Nabanita Chattopadhyay, 2025-02-27 To feed the burgeoning world population global food production must increase drastically This is becoming more challenging with the imminent threats of global climate change especially the incidences of abiotic stresses such as drought heat and salinity are predicted to increase soon Global climate change may also affect plant biotic interactions Additionally modernization in underdeveloped and developing countries is expected to decrease available land for agricultural usage Thus to achieve sustainable agricultural development it is imperative to produce more food without using additional land and other valuable resources including water These necessitates should develop novel rapid and robust crop improvement methods that complement traditional plant breeding approaches Crop improvement strategies to tackle future challenges necessitate the elucidation of underlying genes and gene regulatory networks The dwindling cost of next generation sequencing and the emergence of novel sequencing

approaches such as long read sequencing technology e g PacBio Oxford Nanopore and others are transforming agricultural research at an unprecedented rate is opening a plethora of opportunities in turbocharging crop improvement initiatives Recent advances in next generation sequencing will continue to play a pivotal role in future crop improvement efforts However the progress of genomic technologies has not been uniformed world wide Thus it is now relevant to compile a collection of recent advancements in the field of structural functional and comparative genomics and its relevance to crop improvement so that it is disseminated to a broader audience
