Akivis,Vladislav V. Goldberg,2006-04-18 In this book the authors study the differential geometry of varieties with degenerate Gauss maps They use the main methods of differential geometry namely the methods of moving frames and exterior differential forms as well as tensor methods By means of these methods the authors discover the structure of varieties with degenerate Gauss maps determine the singular points and singular varieties find focal images and construct a classification of the varieties with degenerate Gauss maps The authors introduce the above mentioned methods and apply them to a series of concrete problems arising in the theory of varieties with degenerate Gauss maps What makes this book unique is the authors use of a systematic application of methods of projective differential geometry along with methods of the classical algebraic geometry for studying varieties with degenerate Gauss maps This book is intended for researchers and graduate students interested in projective differential geometry and algebraic geometry and their applications It can be used as a text for advanced undergraduate and graduate students Each author has published over 100 papers and they have each written a number of books including Conformal Differential Geometry and Its Generalizations Wiley 1996 Projective Differential Geometry of Submanifolds North Holland 1993 and Introductory Linear Algebra Prentice Hall 1972 which were written by them jointly **Financial Cryptography** Rebecca N. Rees, 2012-12-06 In recent years geometry has played a lesser role in undergraduate courses than it has ever done Nevertheless it still plays a leading role in mathematics at a higher level Its central role in the history of mathematics has never been disputed It is important therefore to introduce some geometry into university syllabuses There are several ways

of doing this it can be incorporated into existing courses that are primarily devoted to other topics it can be taught at a first year level or it can be taught in higher level courses devoted to differential geometry or to more classical topics These notes are intended to fill a rather obvious gap in the literature It treats the classical topics of Euclidean projective and hyperbolic geometry but uses the material commonly taught to undergraduates linear algebra group theory metric spaces and complex analysis The notes are based on a course whose aim was two fold firstly to introduce the students to some geometry and secondly to deepen their understanding of topics that they have already met What is required from the earlier material is a familiarity with the main ideas specific topics that are used are usually redone

Excursions into Combinatorial Geometry Vladimir Boltyanski,Horst Martini,P.S. Soltan,1996-11-14 The book deals with the combinatorial geometry of convex bodies in finite dimensional spaces A general introduction to geometric convexity is followed by the investigation of d convexity and H convexity and by various applications Recent research is discussed for example the three problems from the combinatorial geometry of convex bodies unsolved in the general case the Szoekfalvi Nagy problem the Borsuk problem the Hadwiger covering problem These and related questions are then applied to a new

class of convex bodies which is a natural generalization of the class of zonoids the class of belt bodies Finally open research problems are discussed Each section is supplemented by a wide range of exercises and the geometric approach to many topics is illustrated with the help of more than 250 figures
