The Financialisation of Power Sarah Bracking, 2016-05-05 The financial crash of 2008 led people all over the world to ask how far financiers are in control of our lives To what extent does what they do with our money affect our everyday lives This book asks whether the crisis and subsequent use of public subsidies to help the international economy recover was a unique event or a symptom of a wider malaise where financiers have effectively usurped the power of governments and are running the political economy themselves The Financialisation of Power in Africa argues that growth is not always a good thing The development of more derivatives and faster financial exchanges are draining businesses of investment capital rather than serving to supply it applying financial logic does not save nature or protect biodiversity and other species This book outlines the concept of financialisation and how it has been used in various ways to explain the post 2008 crisis and global political economy There is a particular focus on these issues in reference to Africa which has a particular dependence on international money It takes the perspective of the modern state exploring how the political economy of development actually works in relation to African governance This book is of interest to students of international development and political economy and is a key source for policy makers interested in African studies and economic development

The Controlled Flood in Grand Canyon Robert H. Webb, 1999-01-26 Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 110 The natural flow of almost every river in the United States has been modified to meet various socioeconomic goals navigation irrigation power generation and flood control The success of the dams and reservoirs built to achieve these goals has been accompanied by changes in the status of riverine resources downstream a cause of growing environmental and ecological concern For example before Glen Canyon Dam was completed the Colorado River transported large quantities of sediment in floods as large as 8500 m³ s After the dam was closed in 1963 dam releases typically were less than the powerplant capacity of 890 m³ s and exhibited large daily flow fluctuations The river carried little sediment The daily fluctuations in flow eroded sand bars and the smaller controlled flow did not redeposit them The clear cold water resulted in increased aquatic productivity such that rainbow trout and other nonnative fishes thrived while most native species were lost or endangered
