Examining Optoelectronics in Machine Vision and Applications in Industry 4.0 Sergiyenko, Oleg, Rodriguez-Quiñonez, Julio C., Flores-Fuentes, Wendy, 2021-02-12 The research and exploitation of optoelectronic properties in the industrial branch of electronics is becoming more popular each day due to the important role they play in the development of a large variety of sensors devices and systems for identifying measuring and constructing While optoelectronics study the applications of electronic devices that source detect and transform light machine vision generates and detects light in order to provide imaging based automatic inspections and analysis for such applications as automatic object and environmental inspection process control and robot mobile machine guidance in industry Machine vision is less efficient without optoelectronics and thus it is important to investigate the theoretical approaches to different optoelectronic devices available for machine vision as well as current scanning technologies Examining Optoelectronics in Machine Vision and Applications in Industry 4 0 focuses on the examination of emerging technologies for the design fabrication and implementation of optoelectronic sensors devices and systems in a machine vision approach to support industrial commercial and scientific applications The book covers topics such as the design fabrication and implementation of sensors and devices as well as the development viewpoint of optoelectronic systems and artificial vision techniques using optoelectronic devices

The interaction and informational communication between all these mentioned devices in the complex solution of the same task is the subject of modern challenges in Industry 4.0. Thus this book supports engineers, technology developers, academicians, researchers, and students who seek machine vision techniques for detection, measurement, and 3D reconstruction.

Federal Information Processing Standards Publication , Electrically Driven Quantum Dot Based Single-Photon Sources Markus Kantner, 2020-01-25 Semiconductor quantum optics is on the verge of moving from the lab to real world applications. When stepping from basic research to new technologies, device engineers will need new simulation tools for the design and optimization of quantum light sources which combine classical device physics with cavity quantum electrodynamics. This thesis aims to provide a holistic description of single photon emitting diodes by bridging the gap between microscopic and macroscopic modeling approaches. The central result is a novel hybrid quantum-classical model system that self-consistently couples semi-classical carrier transport theory with open quantum many-body systems. This allows for a comprehensive description of quantum light emitting diodes on multiple scales. It enables the calculation of the quantum optical figures of merit together with the simulation of the spatially resolved current flow in complex multi-dimensional semiconductor device geometries out of one box. The hybrid system is shown to be consistent with fundamental laws of non-equilibrium thermodynamics and is demonstrated by numerical simulations of realistic devices.
