Catalogue University of Cincinnati, 1916 **University of Cincinnati Record**, 1915 **Directory of Published Proceedings**, 1976 Agrindex, 1977 **Rational Design of Multi-Functional Nanomaterials** Carlos Lodeiro, José Luis Capelo, Hugo Miguel Santos, 2019-08-16

One of the most important issues when a nanomaterial is designed is to control the synthetic pathways to ensure the final desired product. A combination of dry and wet procedures as well as chemical and physical methodologies it is possible to successfully prepare new multifunctional nanomaterials often as a result of multidisciplinary cooperation between chemists, physicists, biologists, physicians, material engineers, etc. Drug delivery, environmental detection of contaminants and many industrial applications directly rely on properties such as water solubility, permeability, cell penetration, shape control and size of the monodispersed nanoparticle among others. Functionalized nanomaterials play a crucial role in modern research areas because of their unique physical and chemical properties explored in many different fields including medicine and biology, new materials, pharmacology as drug delivery systems and in environmental analysis for sensing new contaminants among other technical and industrial applications. For future technological applications, the rational design of these multifunctional nanomaterials is critical and often depends on the excellent control of the organic and inorganic chemical reactions involved during production. The success of their applications relies directly on the photophysical properties created in the final material, including the emission of light or colorimetric responses, water solubility, selectivity, sensitivity, stability, etc. For example, from an analytical point of view, the detection and quantification of emerging analytes is directly dependent on the selectivity and sensitivity showed by the material in a complex media.
