Dhakal,Behzad Hassani,Kun Ji,2024-01-25 As recognized universally by both seismology and earthquake engineering communities the amplitude and frequency content of ground motions are influenced by local site effects including the effects of near surface geologic materials surface topographic and basin effects and so on Strong linkage between seismic site effect and earthquake damage has been commonly demonstrated from many past earthquakes Therefore quantitative and reliable evaluation of the seismic site effect is one of the crucial aspects in seismic hazard assessment and risk mitigation With the significant advancement of modern seismic monitoring networks and arrays huge amounts of high quality seismic records are now being accumulated This encourages us to measure the site responses and its associated uncertainty for selected seismic

stations by some record dependent approaches such as horizontal to vertical spectral ratio HVSR measurements generalized spectral inversion GIT methods etc Machine learning techniques also show significant promise in characterization of the near surface geologic properties and prediction of site response These data driven approaches help us to better understand the physics of spatial and temporal variabilities of ground motions Due to more and more site specific data being captured invoking non ergodic assumptions in seismic response analysis has recently been a topic of great interest in the community For specific site response analysis numerical simulations are carried out to model the dynamic process of seismic waves propagating and scattering in the subsurface strata With development of modeling capacity great efforts have been taken to evaluate quantitatively the complex 2D and 3D effects on seismic site response *English Mechanic and Mirror of Science* ,1873 **English Mechanic and Mirror of Science and Art** ,1884 *Thermal and Structural Performance of Tow-placed, Variable Stiffness Panels* Kingsley Chauncey Wu,2006 In this study a combination of experiments and analyses are performed to characterize the structural response of two variable stiffness composite panels to a series of thermal and mechanical loads This characterization covers all phases of the structure s lifetime from design through global failure These panels are advanced composite structures in which the fiber orientation angle varies continuously as tows are laid down along predefined curvilinear paths within each ply The panels are manufactured from AS4 977 3 graphite epoxy prepreg using an advanced tow placement system Both variable stiffness panels have the same nominal layup but one panel the panel with overlaps has overlapping tow bands of varying thickness and the other panel the panel without overlaps has a theoretically uniform thickness laminate A conventional uniform thickness panel with a straight fiber 45 5s layup the baseline panel is also evaluated **English Mechanic and World of Science** ,1886
