

Task	Explanation
Create a design	Prior to any configuration, a network diagram that illustrates the router interfaces should be created; this diagram should reflect both the LAN and wide area network (WAN) interfaces, as illustrated in Figure 7-5
Use a meaningful router name	Because the name of the router appears in the command line during router configuration, it helps ensure that commands are given to the correct router; for example, if the name <i>Internet_Router</i> is assigned to the device, then the displayed command prompt would be <i>Internet_Router (config)#</i>
Secure all ports	All ports to the router should be secured; this includes both physical ports (sometimes called the console port and auxiliary port) and inbound ports from remote locations (sometimes known as VTY for virtual teletype)
Set a strong administrator password	Most routers allow a user to access the command line in user mode, yet an administrator password is required to move to privileged mode for issuing configuration commands
Make changes from the console	The configuration of the router should be performed from the console and not a remote location; this configuration can then be stored on a secure network drive as a backup and not on a laptop or USB flash drive
