Seismic Design Of Reinforced Concrete And Masonry Buildings:

Seismic Design of Reinforced Concrete and Masonry Buildings Thomas Paulay, M. J. N. Priestley, 1992-04-10
Emphasizes actual structural design not analysis of multistory buildings for seismic resistance Strong emphasis is placed on specific detailing requirements for construction Fundamental design principles are presented to create buildings that respond to a wide range of potential seismic forces which are illustrated by numerous detailed examples The discussion includes the design of reinforced concrete ductile frames structural walls dual systems reinforced masonry structures buildings with restricted ductility and foundation walls In addition to the examples full design calculations are given for three prototype structures Evaluation of Earthquake Damaged Concrete and Masonry Wall Buildings , Seismic Assessment and Retrofit of Reinforced Concrete Buildings fib Fédération internationale du béton, 2003-08-01 In most parts of the developed world the building stock and the civil infrastructure are ageing and in constant need of maintenance repair and upgrading Moreover in the light of our current knowledge and of modern codes the majority of buildings stock and other types of structures in many parts of the world are substandard and deficient This is especially so in earthquake prone regions as even there seismic design of structures is relatively recent In those regions the major part of the seismic threat to human life and property comes from old buildings Due to the infrastructure s increasing decay frequently combined with the need for structural upgrading to meet more stringent design requirements especially against seismic loads structural retrofitting is becoming more and more important and receives today considerable emphasis throughout the world In response to this need a major part of the fib Model Code 2005 currently under development is being devoted to structural conservation and maintenance More importantly in recognition of the importance of the seismic threat arising from existing substandard buildings the first standards for structural upgrading to be promoted by the international engineering community and by regulatory authorities alike are for seismic rehabilitation of buildings This is the case for example of Part 3 Strengthening and Repair of Buildings of Eurocode 8 i e of the draft European Standard for earthquake resistant design and which is the only one among the current 2003 set of 58 Eurocodes attempting to address the problem of structural upgrading It is also the case of the recent 2001 ASCE draft standard on Seismic evaluation of existing buildings and of the 1996 Law for promotion of seismic strengthening of existing reinforced concrete structures in Japan As noted in Chapter 1 of this Bulletin fib as CEB and FIP did before has placed considerable emphasis on assessment and rehabilitation of existing structures The present Bulletin is a culmination of this effort in the special but very important field of seismic assessment and rehabilitation It has been elaborated over a period of 4 years by Task Group 7 1 Assessment and retrofit of existing structures of fib Commission 7 Seismic design a truly international team of experts representing the expertise and experience of all the important seismic regions of the world In the course of its work the team had six plenary two day meetings in January 1999 in Pavia Italy in August 1999 in Raleigh North Carolina in February 2000 in Queenstown New Zealand in July 2000 in Patras Greece in March

2001 in Lausanne Switzerland and in August 2001 in Seattle Washington In October 2002 the final draft of the Bulletin was presented to public during the 1st fib Congress in Osaka It was also there that it was approved by fib Commission 7 Seismic Design The contents is structured into main chapters as follows 1 Introduction 2 Performance objectives and system considerations 3 Review of seismic assessment procedures 4 Strength and deformation capacity of non seismically detailed components 5 Seismic retrofitting techniques 6 Probabilistic concepts and methods 7 Case studies

Seismic Design for Architects Andrew Charleson, 2012-06-25 Seismic Design for Architects shows how structural requirements for seismic resistance can become an integral part of the design process Structural integrity does not have to be at the expense of innovative high standard design in seismically active zones By emphasizing design and discussing key concepts with accompanying visual material architects are given the background knowledge and practical tools needed to deal with aspects of seismic design at all stages of the design process Seismic codes from several continents are drawn upon to give a global context of seismic design Extensively illustrated with diagrams and photographs A non mathematical approach focuses upon the principles and practice of seismic resistant design to enable readers to grasp the concepts and then readily apply them to their building designs Seismic Design for Architects is a comprehensive practical reference work and text book for students of architecture building science architectural and civil engineering and professional architects and structural engineers
