Saridis,2001 This book attempts to couple control engineering with modern developments in science through the concept of entropy Such disciplines as intelligent machines economics manufacturing environmental systems waste etc can be favorably affected and their performance can be improved or their catastrophic effects minimized Entropy is used as the unifying measure of the various seemingly disjoint disciplines to represent the cost of producing work that improves the standard of living both in engineering and in science Modeling is done through probabilistic methods thus establishing the irreversibility of the processes involved This is in accordance with the modern view of science In addition the behavior of control for an arbitrary but fixed controller away from the optimal equilibrium has been obtained the analytic expression of which should lead to chaotic solutions The control activity is explained based on the principle that control is making a system do what we want it to do This helps to relate control theory with the sciences National Library of Medicine Current Catalog National Library of Medicine (U.S.),1965 Toxicology Research Projects Directory ,1980

Physicochemical Treatment Processes Lawrence K. Wang,Yung-Tse Hung,Nazih K. Shammass,2007-11-13 The past 30 years have seen the emergence of a growing desire worldwide to take positive actions to restore and protect the environment from the degrading effects of all forms of pollution air noise solid waste and water Because pollution is a direct or indirect consequence of waste the seemingly idealistic demand for zero discharge can be construed as an unrealistic demand for zero waste However as long as waste exists we can only attempt to abate the subsequent pollution by converting it to a less

noxious form Three major questions usually arise when a particular type of pollution has been identified 1 How serious is the pollution 2 Is the technology to abate it available and 3 Do the costs of abatement justify the degree of abatement achieved The principal intention of the Handbook of Environmental Engineering series is to help readers formulate answers to the last two questions The traditional approach of applying tried and true solutions to specific pollution problems has been a major contributing factor to the success of environmental engineering and has accounted in large measure for the establishment of a methodology of pollution control However realization of the ever increasing complexity and interrelated nature of current environmental problems makes it imperative that intelligent planning of pollution abatement systems be undertaken
