

# File-System Implementation

## CHAPTER 12

### Practice Exercises

- 12.1** Consider a file currently consisting of 100 blocks. Assume that the file-control block (and the index block, in the case of indexed allocation) is already in memory. Calculate how many disk I/O operations are required for contiguous, linked, and indexed (single-level) allocation strategies, if, for one block, the following conditions hold. In the contiguous-allocation case, assume that there is no room to grow at the beginning but there is room to grow at the end. Also assume that the block information to be added is stored in memory.
- The block is added at the beginning.
  - The block is added in the middle.
  - The block is added at the end.
  - The block is removed from the beginning.
  - The block is removed from the middle.
  - The block is removed from the end.

**Answer:**

The results are:

	Contiguous	Linked	Indexed
a.	201	1	1
b.	101	52	1
c.	1	3	1
d.	198	1	0
e.	98	52	0
f.	0	100	0

- 12.2** What problems could occur if a system allowed a file system to be mounted simultaneously at more than one location?

**Answer:**
